The fibnum package

Heiko Oberdiek*
<heiko.oberdiek at googlemail.com>

2016/05/16 v1.1

Abstract

The package fibnum provides expandable fibonacci numbers for both
LaTeX and plain TeX.

Contents

1 Documentation

In the mailing list texhax Jan Abraham asked the question, how to get Fibonacci
numbers in TeX [**texhax:abraham**]:

> Write a Macro in TeX that compute the function \fib{m} All fibonacci
> numbers from 1 to m ($m < 40$).

---

*Please report any issues at https://github.com/ho-tex/oberdiek/issues

1

This packages provides an expandable implementation for the calculation of these numbers for a much larger set of indexes. For practical reasons the index is restricted to the same limitations that apply for TeX integer numbers. The range of the Fibonacci numbers, however, are not limited by the algorithm. They are only restricted to memory limitations, if they are hit.

The package is loaded as LaTeX package in LaTeX:

```
\usepackage{fibnum}
```

and as file in plain TeX:

```
\input fibnum.sty
```

The package does not know any options and it provides the macros `\fibnum` and `\fibnumPreCalc`.

`\fibnum {`$\langle index \rangle$`}`

Macro `\fibnum` expects a TeX number as $\langle index \rangle$ in the official TeX number range from $-(2^{31} - 1)$ up to $2^{31} - 1$. In exact two expansion steps the macro expands to the Fibnoacci number $F_{\langle index \rangle}$. In case of a negative $\langle index \rangle$, the "negafibonacci" number [**wikipedia:negafibonacci**] is used. Formally the Fibonacci number F_n with integer index n, $n \in \mathbb{Z}$ and $n \in [-2\,147\,483\,647, 2\,147\,483\,647]$ that is returned by macro `\fibnum` with numerical argument n is defined the following way:

$$F_n = \begin{cases} 0 & \text{for } n = 0 \\ 1 & \text{for } n = 1 \\ F_{n-1} + F_{n-2} & \text{for } n > 1 \\ (-1)^{n+1} F_n & \text{for } n < 0 \end{cases} \tag{1}$$

Examples:

```
\fibnum{-6}    → -8
\fibnum{-5}    →  5
\fibnum{-4}    → -3
\fibnum{-3}    →  2
\fibnum{-2}    → -1
\fibnum{-1}    →  1
\fibnum{0}     →  0
\fibnum{1}     →  1
\fibnum{2}     →  1
\fibnum{3}     →  2
\fibnum{4}     →  3
\fibnum{5}     →  5
\fibnum{6}     →  8
            ⋮
\fibnum{10}    →  55

            ⋮
\fibnum{46}    →  1836311903

            ⋮
\fibnum{100}   →  354224848179261915075

            ⋮
\fibnum{200}   →  280571172992510140037611932413038677189525

            ⋮
\fibnum{1000}  →  43466557686937456435688527650406258025646
                  60517371780402481729089536555417949051890
                  03879840079255169295922593080322634775209
                  89623239873322471161642996440906533187938
                  29896964992851600370447613779516684922887
```

$\boxed{\texttt{\textbackslash fibnumPreCalc }\{\langle index\rangle\}}$

The package already provides precalculated Fibonacci numbers up to index 46. That means that calculations are not necessary for Fibonacci numbers that fit into the range of TeX numbers. Because macro \fibnum is expandable, it cannot store calculated Fibonacci numbers for later use. Macro definitions are forbidden in expandable contexts. If larger Fibonacci numbers are used more than once, than the compilation time can be shortened by calculating and storing the Fibonacci numbers beforehand. The argument $\langle index\rangle$ is a TeX number and macro \fibnumPreCalc ensures that the Fibonacci numbers F_0 up to $F_{|\langle index\rangle|}$ that are not already known are calculated and stored in internal macros. Internally only non-negative Fibonacci numbers are stored. If $\langle index\rangle$ is negative, then the needed positive Fibonacci numbers are calculated and stored. Example:

```
\fibnumPreCalc{50}
% calculates and stores the values for indexes 47..50.
% (Values for 0..46 are already stored by the package.)
\fibnum{49} % uses the stored value
\fibnum{51} % only calculates F_51 from stored values F_49 and F_50
\fibnumPreCalc{100}
% calculates and stores the values for indexes 51..100
\fibnum{100} % uses the stored value for F_100
\fibnum{-100} % uses the stored value for F_100
```

% $F_{-100} = -F_{100}$ according to equation (1).

2 Implementation

2.1 Identification

1 ⟨*package⟩

Reload check, especially if the package is not used with LaTeX.

4   Installation

4.1   Download

Package.   This package is available on CTAN[1]:

CTAN:macros/latex/contrib/oberdiek/fibnum.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/fibnum.pdf Documentation.

Bundle.   All the packages of the bundle 'oberdiek' are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN:install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard "A Directory Structure for TeX Files" (CTAN:tds/tds.pdf). Directories with `texmf` in their name are usually organized this way.

4.2   Bundle installation

Unpacking.   Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

    unzip oberdiek.tds.zip -d ~/texmf

Script installation.   Check the directory `TDS:scripts/oberdiek/` for scripts that need further installation steps. Package **attachfile2** comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

    chmod +x scripts/oberdiek/pdfatfi.pl
    cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/

---

[1]http://ctan.org/pkg/fibnum

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting docstrip archive. The files are extracted by running the `.dtx` through plain TeX:

```
tex fibnum.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
fibnum.sty                  → tex/generic/oberdiek/fibnum.sty
fibnum.pdf                  → doc/latex/oberdiek/fibnum.pdf
test/fibnum-test1.tex       → doc/latex/oberdiek/test/fibnum-test1.tex
test/fibnum-test-calc.tex   → doc/latex/oberdiek/test/fibnum-test-calc.tex
fibnum.dtx                  → source/latex/oberdiek/fibnum.dtx
```

If you have a `docstrip.cfg` that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

4.4 Refresh file name databases

If your TeX distribution (teTeX, mikTeX, . . .) relies on file name databases, you must refresh these. For example, teTeX users run `texhash` or `mktexlsr`.

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is pdftk, e.g. unpack the file into the current directory:

```
pdftk fibnum.pdf unpack_files output .
```

Unpacking with LaTeX. The `.dtx` chooses its action depending on the format:

plain TeX: Run docstrip and extract the files.

LaTeX: Generate the documentation.

If you insist on using LaTeX for docstrip (really, docstrip does not need LaTeX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{fibnum.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfLaTeX:

```
pdflatex fibnum.dtx
bibtex fibnum.aux
makeindex -s gind.ist fibnum.idx
pdflatex fibnum.dtx
makeindex -s gind.ist fibnum.idx
pdflatex fibnum.dtx
```

5 History

[2012/04/08 v1.0]

- First version.

[2016/05/16 v1.1]

- Documentation updates.

6 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
