

# The `zref` package

Heiko Oberdiek\*  
<heiko.oberdiek at googlemail.com>

2016/05/16 v2.25

## Abstract

Package `zref` tries to get rid of the restriction in L<sup>A</sup>T<sub>E</sub>X's reference system that only two properties are supported. The package implements an extensible referencing system, where properties are handled in a more flexible way. It offers an interface for macro programmers for the access to the system and some applications that uses the new reference scheme.

## Contents

<b>1</b>	<b>Introduction</b>	<b>4</b>
1.1	Standard L <sup>A</sup> T <sub>E</sub> X behaviour . . . . .	4

-----------------	-----------

# 1 Introduction

Standard L<sup>A</sup>T<sub>E</sub>X's reference system with \label, \ref, and \pageref supports two properties, the appearance of the counter that is last incremented by \refstepcounter and the page with the \label command.

Unhappily L<sup>A</sup>T<sub>E</sub>X does not provide an interface for adding another properties. Packages such as hyperref, nameref, or titleref are forced to use ugly hacks to extend the reference system. These ugly hacks are one of the causes for hyperref's difficulty regarding compatibility with other packages.

## 1.1 Standard L<sup>A</sup>T<sub>E</sub>X behaviour

References are created by the \label command:

```
\chapter{Second chapter}
\section{First section on page 7} % section 2.1
\label{myref}
```

Now L<sup>A</sup>T<sub>E</sub>X records the section number 2.1 and the page 7 in the reference. Internally the reference is a list with two entries:

```
\r@myref → {2.1}{7}
```

The length of the list if fixed in the L<sup>A</sup>T<sub>E</sub>X kernel, An interface for adding new properties is missing.

There are several tries to add new properties:

**hyperref** uses a list of five properties instead of the standard list with two entries.  
This causes many compatibility problems with L<sup>A</sup>T<sub>E</sub>X and other packages.

**titleref** stores its title data into the first entry in the list. L<sup>A</sup>T<sub>E</sub>X is happy because it does only see its list with two entries. The situation becomes more difficult, if more properties are added this way. Then the macros form a nested structure inside the first reference argument for the label. Expandable extractions will then become painful.

## 1.2 Basic idea

Some time ago Morten Høgholm sent me an experimental cross referencing mechanism as “expl3” code. His idea is:

```
\g_xref_mylabel plist →  
  \xref_dance_key{salsa}\xref_name_key{Morten}...
```

The entries have the following format:

```
\xref_{your key}_key{some text}
```

This approach is much more flexible:

- New properties can easily be added, just use a new key.
- The length of the list is not fixed. A reference can use a subset of the keys.
- The order of the entries does not matter.

Unhappily I am not familiar with the experimental code for L<sup>A</sup>T<sub>E</sub>X3 that will need some time before its first release. Thus I have implemented it as L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> package without disturbing the existing L<sup>A</sup>T<sub>E</sub>X reference system.

## 1.3 Interfaces

The package provides a generic *interface for programmers*. Commands of this interface are prefixed by `\zref@`.

Option `user` enables the *user interface*. Here the commands are prefixed by `\z` to avoid name clashes with existing macros.

Then the packages provides some *modules*. They are applications for the reference system and can also be considered as examples how to use the reference system.

The modules can be loaded as packages. The package name is prefixed with `zref-`, for example:

```
\RequirePackage{zref-abspage}
```

This is the preferred way if the package is loaded from within other packages to avoid option clashes.

As alternative package `zref` can be used and the modules are given as options:

```
\usepackage[perpage,user]{zref}
```

## 2 Interface for programmers

The user interface is described in the next section 3.

## 2.1 Entities

**Reference.** Internally a reference is a list of key value pairs:

```
\Z@R@myref → \default{2.1}\page{7}
```

The generic format of a entry is:

```
\Z@R@⟨refname⟩ → \⟨propname⟩{⟨value⟩}
```

⟨refname⟩ is the name that denoted references (the name used in \label and \ref). ⟨propname⟩ is the name of the property or key. The property key macro is never executed, it is used in parameter text matching only.

**Property.** Because the name of a property is used in a macro name that must survive the .aux file, the name is restricted to letters and ‘@’.

**Property list.** Often references are used for special purposes. Thus it saves memory if just the properties are used in this reference that are necessary for its purpose.

Therefore this package uses the concept of *property lists*. A property list is a set of properties. The set of properties that is used by the default \label command is the *main property list*.

## 2.2 Property list

<sup>exp</sup> means that the implementation of the marked macro is expandable. <sup>exp<sup>2</sup></sup> goes a step further and marks the macro expandable in exact two expansion steps.

```
\zref@newlist {⟨listname⟩}
```

Declares a new empty property list.

```
\zref@addprop {⟨listname⟩} {⟨propname⟩}  
\zref@localaddprop {⟨listname⟩} {⟨propname⟩}
```

Adds the property ⟨propname⟩ to the property list ⟨listname⟩. The property and list must exist. The addition is global by \zref@addprop and limited to local scope by \zref@localaddprop. Between 2010/04/19 v2.13 and 2010/10/22 v2.19 a comma separated list of properties could be used as argument ⟨propname⟩. Since 2010/10/22 v2.19 the addition of several properties at once is supported by \zref@addprops.

```
\zref@addprops {⟨listname⟩} {⟨propname list⟩}  
\zref@localaddprops {⟨listname⟩} {⟨propname list⟩}
```

These macros add a comma separated list of properties ⟨propname list⟩ to list ⟨listname⟩. \zref@addprops works globally and \zref@localaddprops locally. Since 2010/10/22 v2.19.

```
\zref@listexists {⟨listname⟩} {⟨then⟩}
```

Executes ⟨then⟩ if the property list ⟨listname⟩ exists or raise an error otherwise.

```
\zref@iflistundefinedexp {\⟨listname⟩} {\⟨then⟩} {\⟨else⟩}
```

Executes *⟨then⟩* if the list exists or *⟨else⟩* otherwise.

```
\zref@iflistcontainsprop {\⟨listname⟩} {\⟨propname⟩} {\⟨then⟩} {\⟨else⟩}
```

Executes *⟨then⟩* if the property *⟨propname⟩* is part of property list *⟨listname⟩* or otherwise it runs the *⟨else⟩* part.

## 2.3 Property

```
\zref@newprop* {\⟨propname⟩} [⟨default⟩] {⟨value⟩}
```

This command declares and configures a new property with name *⟨propname⟩*.

In case of unknown references or the property does not exist in the reference, the *⟨default⟩* is used as value. If it is not specified here, a global default is used, see `\zref@setdefault`.

The correct values of some properties are not known immediately but at page shipout time. Prominent example is the page number. These properties are declared with the star form of the command.

```
\zref@setcurrent {\⟨propname⟩} {⟨value⟩}
```

This sets the current value of the property *⟨propname⟩*. It is a generalization of setting L<sup>A</sup>T<sub>E</sub>X's `\currentlabel`.

```
\zref@getcurrentexp2 {\⟨propname⟩}
```

This returns the current value of the property *⟨propname⟩*. The value may not be correct, especially if the property is bound to a page (start form of `\zref@newprop`) and the right value is only known at shipout time (e.g. property 'page'). In case of errors (e.g. unknown property) the empty string is returned.

Since version 2010/04/22 v2.14 `\zref@getcurrent` supports `\zref@wrapper@unexpanded`.

```
\zref@propexists {\⟨propname⟩} {\⟨then⟩}
```

Calls *⟨then⟩* if the property *⟨propname⟩* is available or generates an error message otherwise.

```
\zref@ifpropundefinedexp {\⟨propname⟩} {\⟨then⟩} {\⟨else⟩}
```

Calls *⟨then⟩* or *⟨else⟩* depending on the existence of property *⟨propname⟩*.

## 2.4 Reference generation

```
\zref@label {\⟨refname⟩}
```

This works similar to `\label`. The reference *⟨refname⟩* is created and put into the `.aux` file with the properties of the main property list.

```
\zref@labelbylist {\langle refname\rangle} {\langle listname\rangle}
```

Same as `\zref@label` except that the properties are taken from the specified property list `\langle listname\rangle`.

```
\zref@labelbyprops {\langle refname\rangle} {\langle propnameA\rangle,\langle propnameB\rangle,...}
```

Same as `\zref@label` except that these properties are used that are given as comma separated list in the second argument.

```
\zref@newlabel {\langle refname\rangle} {...}
```

This is the macro that is used in the `.aux` file. It is basically the same as `\newlabel` apart from the format of the data in the second argument.

## 2.5 Data extraction

```
\zref@extractdefaultexp2 {\langle refname\rangle} {\langle propname\rangle} {\langle default\rangle}
```

This is the basic command that references the value of a property `\langle propname\rangle` for the reference `\langle refname\rangle`. In case of errors such as undefined reference the `\langle default\rangle` is used instead.

```
\zref@extractexp2 {\langle refname\rangle} {\langle propname\rangle}
```

The command is an abbreviation for `\zref@extractdefault`. As default the default of the property is taken, otherwise the global default.

Example for page references:

```
LATEX: \pageref{foobar}  
zref: \zref@extract{foobar}{page}
```

Both `\zref@extract` and `\zref@extractdefault` are expandable. That means, these macros can directly be used in expandable calculations, see the example file. On the other side, babel's shorthands are not supported, there are no warnings in case of undefined references.

If an user interface doesn't need expandable macros then it can use `\zref@refused` and `\zref@wrapper@babel` for its user macros.

```
\zref@refused {\langle refname\rangle}
```

This command is not expandable. It causes the warnings if the reference `\langle refname\rangle` is not defined. Use the `\zref@extract` commands inside expandable contexts and mark their use outside by `\zref@refused`, see the example file.

```
\zref@def@extract {\langle cmd\rangle} {\langle refname\rangle} {\langle propname\rangle}  
\zref@def@extractdefault {\langle cmd\rangle} {\langle refname\rangle} {\langle propname\rangle} {\langle default\rangle}
```

Both macros extract the property `\langle propname\rangle` from the reference `\langle refname\rangle` the same way as macros `\zref@extract` and `\zref@extractdefault`. The result is stored in macro `\langle cmd\rangle`. Also `\zref@refused` is called to notify LATEX that the reference `\langle refname\rangle` is used. Added in 2011/10/04 v2.22.

```
\zref@ifrefundefinedexp {\⟨refname⟩} {\⟨then⟩} {\⟨else⟩}
```

Macro `\zref@ifrefundefined` calls arguments `⟨then⟩` or `⟨else⟩` dependent on the existence of the reference `⟨refname⟩`.

```
\zifrefundefined {\⟨refname⟩} {\⟨then⟩} {\⟨else⟩}
```

Macro `\zifrefundefined` calls `\ref@refused` before executing `\zref@ifrefundefined`. Babel shorthands are supported in `⟨refname⟩`.

```
\zref@ifrefcontainspropexp {\⟨refname⟩} {\⟨propname⟩} {\⟨then⟩} {\⟨else⟩}
```

Test whether a reference provides a property.

## 2.6 Setup

```
\zref@default
```

Holds the global default for unknown values.

```
\zref@setdefault {\⟨value⟩}
```

Sets the global default for unknown values. The global default is used, if a property does not specify an own default and the value for a property cannot be extracted. This can happen if the reference is unknown or the reference does not have the property.

```
\zref@setmainlist {\⟨value⟩}
```

Sets the name of the main property list. The package sets and uses `main`.

## 2.7 Declared properties

Module	Property	Property list	Default
(base)	default	main	<empty>
	page	main	<empty>

	externaldocument		<empty>
	theotype		<empty>
	title		<empty>
	url		<empty>

---

<sup>1</sup>Module `pagelayout` only defines properties if the parameter exists.

## 2.8 Wrapper for advanced situations

```
\zref@wrapper@babel {...} {\langle name\rangle}
```

This macro helps to add shorthand support. The second argument is protected, then the code of the first argument is called with the protected name appended. Examples are in the sources.

```
\zref@wrapper@immediate {...}
```

There are situations where a label must be written instantly to the .aux file, for example after the last page. If the \zlabel or \label command is put inside this wrapper, immediate writing is enabled. See the implementation for module `lastpage` for an example of its use.

```
\zref@wrapper@unexpanded {...}
```

Assuming someone wants to extract a value for property `bar` and store the result in a macro `\foo` without traces of the expanding macros and without expanding the value. This (theoretical?) problem can be solved by this wrapper:

```
\zref@wrapper@unexpanded{%
  \edef\foo{%
    \zref@extract{someref}{bar}%
  }%
}
```

The `\edef` forces the expansion of `\zref@extract`, but the extraction of the value is prevented by the wrapper that uses  $\varepsilon$ -TEX' `\unexpanded` for this purpose. Supported macros are `\zref@extract`, `\zref@extractdefault` and since version 2010/04/22 v2.14 macro `\zref@getcurrent`.

## 2.9 Counter for unique names

Some modules (`titleref` and `dotfillmin`) need unique names for automatically generated label names.

```
\zref@require@unique
```

This command creates the unique counter `zref@unique` if the counter does not already exist.

```
\thezref@unique
```

This command is used to generate unique label names.

## 3 User interface

### 3.1 Module user

The user interface for this package and its modules is enabled by `zref`'s package option `user` or package `zref-user`. The names of user commands are prefixed by `z` in

order to avoid name clashes with existing macros of the same functionality. Thus the package does not disturb the traditional reference scheme, both can be used together.

The syntax descriptions contain the following markers that are intended as hints for programmers:

<code>babel</code>	Babel shorthands are allowed.
<code>robust</code>	Robust macro.
<code>exp</code>	Expandable version: <ul style="list-style-type: none"><li>• robust, unless the extracted values are fragile,</li><li>• no babel shorthand support.</li></ul>
<code>exp2</code>	Expandable like <code>exp</code> and: <ul style="list-style-type: none"><li>• expandable in exactly two steps.</li></ul>

The basic user interface of the package without modules are commands that mimic the standard L<sup>A</sup>T<sub>E</sub>X behaviour of `\label`, `\ref`, and `\pageref`:

`\zlabel {⟨refname⟩}babel`

Similar to `\label`. It generates a label with name `⟨refname⟩` in the new reference scheme.

`\zref [⟨propname⟩] {⟨refname⟩}babel`

Without optional argument similar to `\ref`, it returns the default reference property. This property is named `default`:

$\zref{x} \equiv \zref[\text{default}]{x}$

`\zpageref {⟨refname⟩}babel`

Convenience macro, similar to `\pageref`.

$\zpageref{x} \equiv \zref[\text{page}]{x}$

`\zrefused {⟨refname⟩}babel`

Some of the user commands in the modules are expandable. The use of such commands do not cause any undefined reference warnings, because inside of expandable contexts this is not possible. However, if there is a place outside of expandable contexts, `\refused` is strongly recommended. The reference `⟨refname⟩` is marked as used, undefined ones will generate warnings.

### 3.2 Module `abspage`

With the help of package `atbegshi` a new counter `abspage` with absolute page numbers is provided. Also a new property `abspage` is defined and added to the main property list. Thus you can reference the absolute page number:

```
Section \zref{foo} is on page \zpageref{foo}.
This is page \zref[abspage]{foo}
of \zref[abspage]{LastPage}.
```

The example also makes use of module `lastpage`.

### 3.3 Module `lastpage`

Provides the functionality of package `lastpage` [3] in the new reference scheme. The label `LastPage` is put at the end of the document. You can refer the last page number with:

```
\zref@extract{LastPage}{page} (+ \zref@refused{LastPage})
```

or

```
\zpageref{LastPage} (module user)
```

Since version 2008/10/01 v2.3 the module defines the list `LastPage`. In addition to the properties of the main list label `LastPage` also stores the properties of this list `LastPage`. The default of this list is empty. The list can be used by the user to add additional properties for label `LastPage`.

#### 3.3.1 Tests for last page

Since version 2010/03/26 v2.8 the macros `\zref@iflastpage` and `\ziflastpage` were added. They test the reference, whether it is a reference of the last page.

```
\zref@iflastpageexp {\<refname>} {\<then>} {\<else>}
```

Macro `\zref@iflastpage` compares the references `\<refname>` with `\<LastPage>`. Basis of the comparison is the value of property `abspage`, because the values are different for different pages. This is not ensured by property `page`. Therefore module `abspage` is loaded by module `lastpage`. If both values of property `abspage` are present and match, then `\<then>` is executed, otherwise code `\<else>` is called. If one or both references are undefined or lack the property `abspage`, then `\<else>` is executed.

Macro `\zref@iflastpage` is expandable, therefore `\zref@refused` should be called on `\<refname>` and `\<LastPage>`.

```
\ziflastpage {\<refname>} {\<then>} {\<else>}
```

Macro `\ziflastpage` has the same function as `\zref@iflastpage`, but adds support for babel shorthands in `\<refname>` and calls `\zref@refused`. However macro `\ziflastpage` is not expandable.

#### 3.3.2 Example

```
1 (*example-lastpage)
2 %<<END_EXAMPLE
3 \NeedsTeXFormat{LaTeX2e}
4 \documentclass{report}
5
6 \newcounter{foo}
7 \renewcommand*\thefoo{\Alph{foo}}
8
9 \usepackage[zref-lastpage,zref-user][2016/05/16]
10
11 \makeatletter
12 \zref@newprop{thefoo}{\thefoo}
13 \zref@newprop{valuefoo}{\the\value{foo}}
```

```

14 \zref@newprop{chapter}{\thechapter}
15 \zref@addprops{LastPage}{thefoo,valuefoo,chapter}
16 \makeatother
17
18 \newcommand*\foo{%
19   \stepcounter{foo}%
20   [Current foo: \thefoo]%
21 }
22
23 \begin{document}
24   \chapter{First chapter}
25   Last page is \zref{LastPage}.\\
26   Last chapter is \zref[chapter]{LastPage}.\\
27   Last foo is \zref[thefoo]{LastPage}.\\
28   Last value of foo is \zref[valuefoo]{LastPage}.\\
29   \foo
30   \chapter{Second chapter}
31   \foo\foo\foo
32   \chapter{Last chapter}
33   \foo
34 \end{document}
35 %END_EXAMPLE
36 </example-lastpage>

```

### 3.4 Module `thepage`

This module `thepage` loads module `abspage`, constructs a reference name using the absolute page number and remembers property `page`. Other properties can be added by adding them to the property list `thepage`.

`\zthepage {\langle absolute page number\rangle}`

Macro `\zthepage` is basically a `\zpageref`. The reference name is yield by the `\langle absolute page number\rangle`. If the reference is not defined, then the default for property `page` is used.

`\zref@thepage@nameexp {\langle absolute page number\rangle}`

Macro `\zref@thepage@name` returns the internal reference name that is constructed using the `\langle absolute page number\rangle`. The internal reference name should not be used directly, because it might change in future versions.

`\zref@thepageexp {\langle absolute page number\rangle}`
  
`\zref@thepage@refused {\langle absolute page number\rangle}`

Macro `\zref@thepage` returns the page number (`\thepage`) of `\langle absolute page number\rangle`. Because this macro is expandable, `\zref@thepage@refused` is used outside an expandable context to mark the reference as used.

## 3.5 Module `nextpage`

```
\znextpage
```

Macro `\znextpage` prints `\thepage` of the following page. It gets the current absolute page number by using a label. There are three cases for the next page:

1. The next page is not known yet because of undefined references. Then `\zunknnownnextpagename` is used instead. The default for this macro is the default of property `page`.
2. This page is the last page. Then `\znonextpagename` is used. Its default is empty.
3. The next page is known, then `\thepage` of the next page is used (the value of property `page` of the next page).

### 3.5.1 Configuration

The behaviour can be configured by the following macros.

```
\zunknnownnextpagename  
\znonextpagename
```

If the next page is not known or available, then `\znextpage` uses these name macros as default. `\zunknnownnextpagename` is used in case of undefined references. Default is the value of property `page` of the next page (`\thepage`). Module `thepage` is used.

Macro `\znonextpagename` is used, if the next page does not exists. That means that the current page is last page. The default is empty.

```
\znextpagesetup {\{unknown\}} {\{no next\}} {\{next\}}
```

According to the case (see `\znextpage`) macro `\znextpage` calls an internal macro with an argument. The argument is either `\thepage` of the next page or one of `\zunknnownnextpagename` or `\znonextpagename`. These internal macro can be changed by `\znextpagesetup`. It expects the definition texts for these three cases of a macro with one argument. The default is

```
\znextpagesetup{\#1}{\#1}{\#1}
```

### 3.5.2 Example

```
37 (*example-nextpage)  
38 %<<END_EXAMPLE  
39 \documentclass{book}  
40  
41 \usepackage[zref-nextpage][2016/05/16]  
42 \znextpagesetup  
43 {\thepage}% next page is unknown  
44 {\thepage\ (#1)}% this page is last page  
45 {\thepage\$ \rightarrow \$ #1}% next page is known  
46 \renewcommand*\znonextpagename{last page}  
47  
48 \usepackage{fancyhdr}
```

```

49 \pagestyle{fancy}
50 \fancyhf{}
51 \fancyhead[LE,RO]{\znextpage}
52 \fancypagestyle{plain}{%
53   \fancyhf{}%
54   \fancyhead[LE,RO]{\znextpage}%
55 }
56
57 \begin{document}
58 \frontmatter
59 \tableofcontents
60 \mainmatter
61 \chapter{Hello World}
62 \clearpage
63 \section{Last section}
64 \end{document}
65 %END_EXAMPLE
66 (/example-nextpage)

```

### 3.6 Module `totpages`

For the total number of pages of a document you need to know the absolute page number of the last page. Both modules `abspage` and `lastpage` are necessary and automatically enabled.

`\ztotpagesexp`

Prints the total number of pages or 0 if this number is not yet known. It expands to an explicit number and can also be used even in expandable calculations (`\numexpr`) or counter assignments.

### 3.7 Module `pagelayout`

The module defines additional properties for each parameter of the page layout that is effective during page shipout. The value of length parameters is given in sp without the unit as plain number.

Some parameters are specific for a class (e.g. `stockwidth` and `stockheight` for class `memoir`) or the TeX engine like pdfTeX. If the parameter is not available, then the property will not be defined. The default value of the property is the current setting of the parameter.

The module `thepage` is loaded that generates a label for each page. The properties of module `pagelayout` are added to the property list `thepage` of module `thepage`.

List of properties:

parameter	property	remarks
\mag	mag	
\paperwidth	paperwidth	
\paperheight	paperheight	
\stockwidth	stockwidth	class memoir
\stockheight	stockheight	class memoir
\pdfpagewidth	pdfpagewidth	pdfTeX, LuaTeX
\pdfpageheight	pdfpageheight	pdfTeX, LuaTeX
\pdfhorigin	pdfhorigin	pdfTeX, LuaTeX
\pdfvorigin	pdfvorigin	pdfTeX, LuaTeX
\hoffset	hoffset	
\voffset	voffset	
\topmargin	topmargin	
\oddsidemargin	oddsidemargin	
\evensidemargin	evensidemargin	
\textwidth	textwidth	
\textheight	textheight	
\headheight	headheight	
\headsep	headsep	
\footskip	footskip	
\marginparwidth	marginparwidth	
\marginparsep	marginparsep	
\columnwidth	columnwidth	
\columnsep	columnsep	

\zlistpagelayout

At the end of document the page layout parameter for each page are printed into the .log file if macro \zlistpagelayout is called before \end{document} (preamble is a good place).

### 3.8 Module marks

ToDo.

### 3.9 Module runs

Module runs counts the L<sup>A</sup>T<sub>E</sub>X runs since last .aux file creation and prints the number in the .log file.

\zruns<sup>exp</sup>

Prints the the total number of L<sup>A</sup>T<sub>E</sub>X runs including the current one. It expands to an explicit number. Before begin{document} the value is zero meaning the .aux file is not read yet. If a previous .aux file exists, the value found there increased by one is the new number. Otherwise \zruns is set to one. L<sup>A</sup>T<sub>E</sub>X runs where the .aux files are not rewritten are not counted (see \nofiles).

### 3.10 Module perpage

With \addtoreset or \numberwithin a counter can be reset if another counter is incremented. This do not work well if the other counter is the page counter. The page counter is incremented in the output routine that is often called asynchronous

somewhere on the next page. A reference mechanism costs at least two L<sup>A</sup>T<sub>E</sub>X runs, but ensures correct page counter values.

```
\zmakeperpage [reset] {counter}
```

At the of a new page counter *counter* starts counting with value *reset* (default is 1). The macro has the same syntax and semantics as \MakePerPage of package *perpage* [5]. Also *perpage* of package *footmisc* [1] can easily be simulated by

```
\zmakeperpage{footnote} % \usepackage[perpage]{footmisc}
```

If footnote symbols are used, some people dislike the first symbol †. It can easily be skipped:

```
\zmakeperpage[2]{footnote}
```

```
\thezpage  
counter zpage
```

If the formatted counter value of the counter that is reset at a new page contains the page value, then you can use \thezpage, the page number of the current page. Or counter *zpage* can be used, if the page number should be formatted differently from the current page number. Example:

```
\newcounter{foobar}  
\zmakeperpage{foobar}  
\renewcommand*{\thefoobar}{\thezpage-\arabic{foobar}}  
% or  
\renewcommand*{\thefoobar}{\roman{zpage}-\arabic{foobar}}
```

```
\zunmakeperpage {counter}
```

The reset mechanism for this counter is deactivated.

### 3.11 Module **counter**

This option just add the property **counter** to the main property list. The property stores the counter name, that was responsible for the reference. This is the property **hyperref**'s \autoref feature uses. Thus this property **counter** may be useful for a reimplemention of the autoref feature, see the section 4 with the todo list.

### 3.12 Module **titleref**

This option makes section and caption titles available to the reference system similar to packages **titleref** or **nameref**.

```
\ztitleref {refname}babel
```

Print the section or caption title of reference *refname*, similar to \nameref or \titleref.

```
\ztitlerefsetup {key1=value1, key2=value2, ...}
```

This command allows to configure the behaviour of module `titleref`. The following keys are available:

**title=***<value>*

Sets the current title.

**stripperiod=true|false**

Follow package `nameref` that removes a last period. Default: `true`.

**expand=true|false**

Package `\titleref` expands the title first. This way garbage and dangerous commands can be removed, e.g. `\label`, `\index`.... See implementation section for more details. Default is `false`.

**cleanup={...}**

Hook to add own cleanup code, if method `expand` is used. See implementation section for more details.

### 3.13 Module `savepos`

This option supports a feature that pdfTeX provides (and XeTeX). pdfTeX is able to tell the current position on the page. The page position is not instantly known. First the page must be constructed by TeX's asynchronous output routine. Thus the time where the position is known is the page shipout time. Thus a reference system where the information is recorded in the first run and made available for use in the second run comes in handy.

```
\zsavepos {\langle refname\rangle}
```

It generates a reference with name *<refname>*. The reference stores the location where `\zsavepos` is executed in properties `posx` and `posy`.

```
\zsaveposx {\langle refname\rangle}  
\zsaveposy {\langle refname\rangle}
```

Same as `\zsavepos` except that only the x or y component of the position is stored. Since 2011/12/05 v2.23.

```
\zposxexp {\langle refname\rangle}  
\zposyexp {\langle refname\rangle}
```

Get the position as number. Unit is sp. Horizontal positions by `\zposx` increase from left to right. Vertical positions by `\zposy` from bottom to top.

Do not rely on absolute page numbers. Because of problems with the origin the numbers may differ in DVI or PDF mode of pdfTeX. Therefore work with relative values by comparisons.

Both `\zposx` and `\zposy` are expandable and can be used inside calculations (`\setcounter`, `\addtocounter`, package `calc`, `\numexpr`). However this property prevents from notifying L<sup>A</sup>T<sub>E</sub>X that the reference is actually used (the notifying is not expandable). Therefore you should mark the reference as used by `\zrefused`.

This module uses pdfTeX's `\pdfsavepos`, `\pdflastxpos`, and `\pdflastypos`. They are available in PDF mode and since version 1.40.0 also in DVI mode.

```
\zref@savepos
```

Macro `\zref@savepos` performs the first part of `\zsavepos` by calling `\pdfsavepos` (if .aux files are writable).

Thus `\zsavepos` is basically `\zref@savepos` followed by `\zref@labelbylist{\refname}{savepos}`. If `\TeXeTstate` is detected and enabled, `\savepos` also adds `\zref@savepos` at the end to support `\begin{R}` where the whatits are processed in reverse order. The property list `savepos` contains the properties `posx` and `posy`.

### 3.14 Module `dotfill`

```
\zdotfill
```

This package provides the command `\zdotfill` that works similar to `\dotfill`, but can be configured. Especially it suppresses the dots if a minimum number of dots cannot be set.

```
\zdotfillsetup {key1=value1, key2=value2, ...}
```

This command allows to configure the behaviour of `\zdotfill`. The following keys are available:

`min=⟨count value⟩`

If the actual number of dots are smaller than `⟨count value⟩`, then the dots are suppressed. Default: 2.

`unit=⟨dimen value⟩`

The width of a dot unit is given by `⟨dimen value⟩`. Default: `0.44em` (same as the unit in `\dotfill`).

`dot=⟨value⟩`

The dot itself is given by `⟨value⟩`. Default: `.` (dot, same as the dot in `\dotfill`).

### 3.15 Module `env`

This module defines two properties `envname` and `envline`. They remember the name of the environment and the line number at the start of the environment.

### 3.16 Module `xr`

This package provides the functionality of package `xr`, see [8]. It also supports the syntax of `xr-hyper`.

```
\zexternaldocument * [⟨prefix⟩]babel {⟨external document⟩} [⟨url⟩]
```

See `\externaldocument` for a description of this option. The found labels also get a property `externaldocument` that remembers `⟨external document⟩`. The standard reference scheme and the scheme of this package use different name spaces for reference names. If the external document uses both systems. Then one import statement would put the names in one namespace and probably causing problems with multiple references of the same name. Thus the star form only looks

for `\newlabel` in the `.aux` files, whereas without star only `\zref@newlabels` are used.

In the star form it tries to detect labels from `hyperref`, `titleref`, and `ntheorem`. If such an extended property from the packages before cannot be found or are empty, they are not included in the imported reference.

Warnings are given if a reference name is already in use and the item is ignored. Unknown properties will automatically be declared.

If the external references contain `anchor` properties, then we need also a url to be able to address the external file. As default the filename is taken with a default extension.

```
\zxrsetup {key1=value1, key2=value2, ...}
```

The following setup options are available:

**ext:** It sets the default extension.

**tozreflabel:** Boolean option. The found references are imported as zref labels.  
This is enabled by default.

**tolt xlabel:** Boolean option. The found references are imported as L<sup>A</sup>T<sub>E</sub>X labels.  
Packages `nameref`, `titleref` and class `memoir` are supported.

**urluse:** Boolean option. If enabled, then a URL is stored in a macro and the macro is put in property ‘urluse’. The URL is not put in property ‘url’. The purpose is to save T<sub>E</sub>X memory.

**verbose:** Boolean option. List the imported labels in the `.log` file. Default is `false`.

```
\zref@xr@ext
```

If the `\langle url \rangle` is not specified in `\zref@externaldocument`, then the url will be constructed with the file name and this macro as extension. `\XR@ext` is used if `hyperref` is loaded, otherwise `pdf`.

## 4 ToDo

Among other things the following issues are left for future work:

- Other applications: `autoref`, `hyperref`, ...

## 5 Example

```
67 {*example}
68 \documentclass{book}
69
70 \usepackage[ngerman]{babel}%
71
72 \usepackage[savepos,totpages,titleref,dotfill,counter,user]{zref}
73
```

Chapters are wrapped inside `\ChapterStart` and `\ChapterStop`. The first argument `#1` of `\ChapterStart` is used to form a label id `chap:#1`. At the end of

the chapter another label is set by `\zref@wrapper@immediate`, because otherwise at the end of document a deferred write would not be written, because there is no page for shipout.

Also this example shows how chapter titles can be recorded. A new property `chapttitle` is declared and added to the main property list. In `\ChapterStart` the current value of the property is updated.

```

74 \makeatletter
75 \zref@newprop{chapttitle}{}
76 \zref@addprop{main}{chapttitle}
77
78 \newcommand*\{\ChapterStart}[2]{%
79   \cleardoublepage
80   \def\current@chapid{\#1}%
81   \zref@setcurrent{chapttitle}{\#2}%
82   \chapter{\#2}%
83   \zlabel{chap:\#1}%
84 }
85 \newcommand*\{\ChapterStop}{%
86   \cleardoublepage
87   \zref@wrapper@immediate{%
88     \zref@labelbyprops{chapend:\current@chapid}{abspage}%
89   }%
90 }

```

`\ChapterPages` calculates and returns the number of pages of the referenced chapter.

```

91 \newcommand*\{\ChapterPages}[1]{%
92   \zrefused{chap:\#1}%
93   \zrefused{chapend:\#1}%
94   \number\numexpr
95     \zref@extract{chapend:\#1}{abspage}%
96     -\zref@extract{chap:\#1}{abspage}%
97     +1\relax
98 }
99 \makeatother
100 \begin{document}

```

As exception we use `\makeatletter` here, because this is just an example file that also should show some of programmer's interface.

```

101 \makeatletter
102
103 \frontmatter
104 \zlabel{documentstart}
105
106 \begin{itemize}
107 \item
108   The frontmatter part has
109   \number\numexpr\zref@extract{chap:first}{abspage}-1\relax
110   ~pages.
111 \item
112   Chapter \zref{chap:first} has \ChapterPages{first} page(s).
113 \item
114   Section \zref{hello} is on the
115   \ifcase\numexpr
116     \zref@extractdefault{hello}{page}\{0\}%
117     -\zref@extractdefault{chap:first}{page}\{0\}%
118     +1\relax
119     ??\or first\or second\or third\or forth\fi
120   ~page inside its chapter.

```

```

121 \item
122   The document has
123   \zref[abspage]{LastPage} pages.
124   This number is \ifodd\ztotpages odd\else even\fi.
125 \item
126   The last page is labeled with \zpageref{LastPage}.
127 \item
128   The title of chapter \zref{chap:next} %
129   is ``\zref[chaptitle]{chap:next}''.
130 \end{itemize}
131
132 \tableofcontents
133
134 \mainmatter
135 \ChapterStart{first}{First chapter}
136

```

The user level commands should protect babel shorthands where possible. On the other side, expandable extracting macros are useful in calculations, see above the examples with `\numexpr`.

```

137 \section{Test}
138 \zlabel{a"o}
139 Section \zref{a"o} on page
140 \zref@wrapper@babel\zref@extract{a"o}{page}.
141
142 Text.
143 \newpage
144
145 \section{Hello World}
146 \zlabel{hello}
147
148 \ChapterStop
149
150 \ChapterStart{next}{Next chapter with \emph{umlauts}: "a"o"u"s}
151

```

Here an example follows that makes use of pdf<sub>TEX</sub>'s “`savepos`” feature. The position on the page is not known before the page is constructed and shipped out. Therefore the position ist stored in references and are available for calculations in the next <sub>La</sub>T<sub>E</sub>X compile run.

```

152 The width of the first column is
153   \the\dimexpr \zposx{secondcol}sp - \zposx{firstcol}sp\relax,\\
154 the height difference of the two baselines is
155   \the\dimexpr \zposy{firstcol}sp - \zposy{secondline}sp\relax:\\
156 \begin{tabular}{ll}
157   \zsavepos{firstcol}Hello&\zsavepos{secondcol}World\\
158   \zsavepos{secondline}Second line&foobar\\
159 \end{tabular}
160

```

With `\zrefused` <sub>La</sub>T<sub>E</sub>X is notified, if the references are not yet available and <sub>La</sub>T<sub>E</sub>X can generate the rerun hint.

```

161 \zrefused{firstcol}
162 \zrefused{secondcol}
163 \zrefused{secondline}
164
165 \ChapterStop

```

Test for module `\dotfill`.

```
166 \ChapterStart{dotfill}{Test for dotfill feature}
```

```

167 \newcommand*{\dftest}[1]{%
168   #1&
169   [\makebox[\#1]{\dotfill}]&
170   [\makebox[\#1]{\zdotfill}]\ \\
171 }
172 \begin{tabular}{r|l}
173 & [\verb|\dotfill|] & [\verb|\zdotfill|]\\
174 \dftest{0.43em}\\

177 \dftest{0.87em}\\
178 \dftest{0.88em}\\
179 \dftest{0.89em}\\
180 \dftest{1.31em}\\
181 \dftest{1.32em}\\
182 \dftest{1.33em}\\
183 \end{tabular}\\
184 \ChapterStop\\
185 \end{document}\\
186 
```

## 6 Implementation

### 6.1 Package zref

#### 6.1.1 Identification

```

187 (*package)
188 \NeedsTeXFormat{LaTeX2e}
189 \ProvidesPackage{zref}
190 [2016/05/16 v2.25 A new reference scheme for LaTeX (HO)]%

```

#### 6.1.2 Load basic module

```
191 \RequirePackage{zref-base}[2016/05/16]
```

Abort package loading if zref-base could not be loaded successfully.

```
192 \@ifundefined{ZREF@base@ok}{\endinput}{}%
```

#### 6.1.3 Process options

Known modules are loaded and the release date is checked.

```

193 \def\ZREF@temp#1{%
194   \DeclareOption#1{%
195     \AtEndOfPackage{%
196       \RequirePackage{zref-#1}[2016/05/16]%
197     }%
198   }%
199 }
200 \ZREF@temp{abspage}
201 \ZREF@temp{counter}
202 \ZREF@temp{dotfill}
203 \ZREF@temp{hyperref}
204 \ZREF@temp{lastpage}
205 \ZREF@temp{marks}

216 \ZREF@temp{xr}

217 \ProcessOptions\relax
218 
```

## 6.2 Module base

### 6.2.1 Prefixes

This package uses the following prefixes for macro names:

- \zref@: Macros of the programmer's interface.
- \ZREF@: Internal macros.
- \Z@L@*listname*: The properties of the list *<listname>*.
- \Z@D@*propname*: The default value for property *<propname>*.
- \Z@E@*propname*: Extract function for property *<propname>*.
- \Z@X@*propname*: Information whether a property value for property *<propname>* is expanded immediately or at shipout time.
- \Z@C@*propname*: Current value of the property *<propname>*.
- \Z@R@*labelname*: Data for reference *<labelname>*.
- \ZREF@org@: Original versions of patched commands.
- \z: For macros in user land, defined if module `user` is set.

The following family names are used for keys defined according to the `keyval` package:

`ZREF@TR`: Setup for module `titleref`.

### 6.2.2 Identification

```

219 (*base)
220 \NeedsTeXFormat{LaTeX2e}
221 \ProvidesPackage{zref-base}%

253     \csname #1\endcsname
254     \ltx@firstofone
255   }%
256 }%

```

#### 6.2.4 Check for $\varepsilon$ -TeX

The use of  $\varepsilon$ -TeX should be standard nowadays for L<sup>A</sup>T<sub>E</sub>X. We test for  $\varepsilon$ -TeX in order to use its features later.

```

257 \ltx@ifUndefined{eTeXversion}{%
258   \PackageError\ZREF@name{%
259     Missing support for eTeX; package is abandoned%
260   }{%
261     Use a TeX compiler that support eTeX and enable eTeX %
262     in the format.%
263   }%
264   \endinput
265 }{}%
266 \RequirePackage{etexcmds}[2007/09/09]
267 \ifetex@unexpanded
268 \else
269   \PackageError\ZREF@name{%

275   redefines \string\unexpanded%
276 }%
277 \expandafter\endinput
278 \fi

```

### 6.2.5 Auxiliary file stuff

We are using some commands in the .aux files. However sometimes these auxiliary files are interpreted by L<sup>A</sup>T<sub>E</sub>X processes that haven't loaded this package (e.g. package `xr`). Therefore we provide dummy definitions.

```

279 \RequirePackage{auxhook}
280 \AddLineBeginAux{%
281   \string\providetcommand\string\zref@newlabel[2]{}}%
282 }

```

`\ZREF@RefPrefix`

```
283 \def\ZREF@RefPrefix{Z@R}
```

`\zref@newlabel` For the implementation of `\zref@newlabel` we call the same internal macro `\@newl@bel` that is used in `\newlabel`. Thus we have for free:

- `\ZREF@labelname` is defined.
- L<sup>A</sup>T<sub>E</sub>X's check for multiple references.
- L<sup>A</sup>T<sub>E</sub>X's check for changed references.

```

284 \ZREF@Robust\edef\zref@newlabel{%
285   \noexpand\@newl@bel{\ZREF@RefPrefix}%
286 }

```

### 6.2.6 Property lists

`\zref@newlist` Property lists are stored as list of property names enclosed in curly braces. `\zref@newlist` creates a new list as empty list. Assignments to property lists are global.

```

287 \ZREF@Robust\def\zref@newlist#1{%
288   \zref@iflistundefined{#1}{%
289     \@ifdefinable{Z@L@#1}{%
290       \global\expandafter\let\csname Z@L@#1\endcsname\ltx@empty
291       \PackageInfo\ZREF@name{New property list: #1}%
292     }%
293   }{%
294     \PackageError\ZREF@name{%
295       Property list '#1' already exists%
296     }\@ehc
297   }%
298 }

```

`\zref@iflistundefined` `\zref@iflistundefined` checks the existence of the property list #1. If the property list is present, then #2 is executed and #3 otherwise.

```

299 \def\zref@iflistundefined#1{%
300   \ltx@ifundefined{Z@L@#1}%
301 }

```

```

\zref@listexists \zref@listexists only executes #2 if the property list #1 exists and raises an
error message otherwise.
302 \ZREF@Robust\def\zref@listexists#1{%
303   \zref@iflistundefined{#1}{%
304     \PackageError\ZREF@name{%
305       Property list '#1' does not exist}%
306     }\@ehc
307   }%
308 }

\zref@iflistcontainsprop \zref@iflistcontainsprop checks, whether a property #2 is already present in
a property list #1.

### 6.2.7 Properties

\zref@ifpropundefined \zref@ifpropundefined checks the existence of the property #1. If the property is present, then #2 is executed and #3 otherwise.

```

484 \def\zref@ifpropundefined#1{%
485   \ltx@ifundefined{Z@E@#1}%
486 }

```

\zref@propexists Some macros rely on the existence of a property. \zref@propexists only executes #2 if the property #1 exists and raises an error message otherwise.

```

487 \ZREF@Robust\def\zref@propexists#1{%
488   \zref@ifpropundefined{#1}{%
489     \PackageError\ZREF@name{%
490       Property '#1' does not exist}%
491     }{\@ehc}%
492   }%
493 }

```

\zref@newprop A new property is declared by \zref@newprop, the property name *propname* is given in #1. The property is created and configured. If the star form is given, then the expansion of the property value is delayed to page shipout time, when the reference is written to the .aux file.

\Z@D@*propname*: Stores the default value for this property.

\Z@E@*propname*: Extract function.

\Z@X@*propname*: Information whether the expansion of the property value is delayed to shipout time.

\Z@C@*propname*: Current value of the property.

```

494 \ZREF@Robust\def\zref@newprop{%

### 6.2.9 Reference querying and extracting

Design goal for the extracting macros is that the extraction process is full expandable. Thus these macros can be used in expandable contexts. But there are problems that cannot be solved by full expandable macros:

- In standard L<sup>A</sup>T<sub>E</sub>X undefined references sets a flag and generate a warning. Both actions are not expandable.
- Babel's support for its shorthand uses commands that use non-expandable assignments. However currently there is hope, that primitives are added to pdfT<sub>E</sub>X that allows the detection of contexts. Then the shorthand can

detect, if they are executed inside `\csname` and protect themselves automatically.

`\zref@ifrefundefined` If a reference #1 is undefined, then macro `\zref@ifrefundefined` calls #2 and #3 otherwise.

```
759 \def\zref@ifrefundefined#1{%
760   \ltx@ifundefined{Z@R@#1}%
761 }
```

`\zifrefundefined` If a reference #1 is undefined, then macro `\zref@ifrefundefined` calls #2 and #3 otherwise. Also the reference is marked used.

```
762 \ZREF@IfDefinable\zifrefundefined\def{%
763   #1{%
764     \zref@wrapper@babel\ZREF@ifrefundefined{#1}%
765   }%
766 }
```

`\ZREF@ifrefundefined`

```
767 \def\ZREF@ifrefundefined#1{%
768   \zref@refused{#1}%
769   \zref@ifrefdefined{#1}%
770 }
```

`\zref@refused` The problem with undefined references is addressed by the macro `\zref@refused`. This can be used outside the expandable context. In case of an undefined reference the flag is set to notify L<sup>A</sup>T<sub>E</sub>X and a warning is given.

```
771 \ZREF@Robust\def\zref@refused#1{%
772   \zref@wrapper@babel\ZREF@refused{#1}%
773 }
```

`\ZREF@refused`

```
774 \def\ZREF@refused#1{%
775   \zref@ifrefdefined{#1}{%
776     \protect\G@refundefinedtrue
777     \@latex@warning{%
778       Reference ‘#1’ on page \thepage \space undefined%
779     }%
780   }{}%
781 }
```

`\zref@ifrefcontainsprop` `\zref@ifrefcontainsprop` looks, if the reference #1 has the property #2 and calls then #3 and #4 otherwise.

```
782 \def\zref@ifrefcontainsprop#1#2{%
783   \zref@ifrefdefined{#1}{%
784     \ltx@secondoftwo
785   }{%

 893     \fi
 894   {%
 895     \begingroup
 896       \csname @safe@activestrue\endcsname
 897       \edef\x{#2}%
 898       \expandafter\endgroup
 899       \expandafter\ZREF@wrapper@babel\expandafter{\x}{#1}%
 900     }%
 901   }{%
 902     #1{#2}%
 903   }%
 904 }
 905 \long\def\ZREF@wrapper@babel#1#2{%
 906   #2{#1}%
 907 }
```

### 6.2.11 Unique counter support

\zref@require@unique Generate the counter `zref@unique` if the counter does not already exist.

```
908 \ZREF@Robust\def\zref@require@unique{%
909   \@ifundefined{c@zref@unique}{%
910     \begingroup
911       \let\@addtoreset\ltx@gobbletwo
912       \newcounter{zref@unique}%
913     \endgroup
914 }
```

\thezref@unique `\thezref@unique` is used for automatically generated unique labelnames.

```
915   \renewcommand*{\thezref@unique}{%
916     zref@\number\c@zref@unique
917   }{%
918 }
```

### 6.2.12 Utilities

```
\ZREF@number
 919 \ltx@ifUndefined{numexpr}{%
 920   \def\ZREF@number#1{\number#1}%
 921 }{%
 922   \def\ZREF@number#1{\the\numexpr(#1)\relax}%
 923 }
```

### 6.2.13 Setup

\zref@setdefault Standard L<sup>A</sup>T<sub>E</sub>X prints “??” in bold face if a reference is not known. \zref@default holds the text that is printed in case of unknown references and is used, if the default was not specified during the definition of the new property by \ref@newprop. The global default value can be set by \zref@setdefault.

```
924 \ZREF@Robust\def\zref@setdefault#1{%
925   \def\zref@default{\#1}%
926 }
```

\zref@default Now we initialize \zref@default with the same value that L<sup>A</sup>T<sub>E</sub>X uses for its undefined references.

```
927 \zref@setdefault{%
928   \nfss@text{\reset@font\bfseries ??}%
929 }
```

### Main property list.

\zref@setmainlist The name of the default property list is stored in \ZREF@mainlist and can be set by \zref@setmainlist.

```
930 \ZREF@Robust\def\zref@setmainlist#1{%
931   \def\ZREF@mainlist{\#1}%
932 }
933 \zref@setmainlist{main}
```

Now we create the list.

```
934 \zref@newlist\ZREF@mainlist
```

**Main properties.** The two properties default and page are created and added to the main property list. They store the data that standard L<sup>A</sup>T<sub>E</sub>X uses in its references created by \label.

default the appearance of the latest counter that is incremented by \refstepcounter

page the appearance of the page counter

```
935 \zref@newprop{default}{\@currentlabel}
936 \zref@newprop*{page}{\thepage}
937 \zref@addprops\ZREF@mainlist{default,page}
```

### Properties

#### \ZREF@NewPropAnchor

```
938 \def\ZREF@NewPropAnchor{%
939   \zref@newprop{anchor}{%
940     \ltx@ifundefined{@currentHref}{}{\@currentHref}%
941   }%
942   \global\let\ZREF@NewPropAnchor\relax
943 }
```

\zref@titleref@current Later we will redefine the section and caption macros to catch the current title and remember the value in \zref@titleref@current.

#### \ZREF@NewPropTitle

```
944 \def\ZREF@NewPropTitle{%
945   \gdef\zref@titleref@current{}%
946   \zref@newprop{title}{\zref@titleref@current}%
947   \global\let\ZREF@NewPropTitle\relax
948 }
```

```

\ZREF@NewPropTheotype
949 \def\ZREF@NewPropTheotype{%
950   \zref@newprop{theotype}{ }%
951   \global\let\ZREF@NewPropTheotype\relax
952 }

\ZREF@NewPropPageValue
953 \def\ZREF@NewPropPageValue{%
954   \zref@newprop*[pagevalue][0]{\number\c@page}%
955   \global\let\ZREF@NewPropPageValue\relax
956 }

```

### Mark successful loading

```

957 \let\ZREF@base@ok=Y
958 (/base)

```

## 6.3 Module user

```

959 (*user)
960 \NeedsTeXFormat{LaTeX2e}
961 \ProvidesPackage{zref-user}{%
962   [2016/05/16 v2.25 Module user for zref (HO)]%
963   \RequirePackage{zref-base}[2016/05/16]
964   \ifx\ZREF@base@ok Y%
965   \else
966     \expandafter\endinput
967   \fi

```

Module user enables a small user interface. All macros are prefixed by `\z`.

First we define the pendants to the standard L<sup>A</sup>T<sub>E</sub>X referencing commands `\label`, `\ref`, and `\pageref`.

`\zlabel` Similar to `\label` the macro `\zlabel` writes a reference entry in the `.aux` file. The main property list is used. Also we add the babel patch. The `\label` command can also be used inside section titles, but it must not go into the table of contents. Therefore we have to check this situation.

```

968 \newcommand*\zlabel{%
969   \ifx\label\ltx@gobble
970     \expandafter\ltx@gobble
971   \else
972     \expandafter\zref@wrapper@babel\expandafter\zref@label
973   \fi
974 }%

```

### \zkvlabel

```

975 \newcommand*{\zkvlabel}[1]{%
976   \ifx\label\ltx@gobble
977     \expandafter\ltx@gobblethree
978   \fi
979   \zref@wrapper@babel{\zref@labelbykv{#1}}%
980 }%

```

`\zref` Macro `\zref` is the corresponding macro for `\ref`. Also it provides an optional argument in order to select another property.

```

981 \newcommand*{\zref}[2][default]{% robust because of optional argument
982   \zref@propexists{#1}{%
983     \zref@wrapper@babel\ZREF@zref{#2}{#1}%

```

```

984   }%
985 }%
986 \def\ZREF@zref#1{%
987   \zref@refused{#1}%
988   \zref@extract{#1}%
989 }%

```

\zpageref For macro \zpageref we just call \zref with property page.

```

990 \ZREF@IfDefinable\zpageref\def{%
991   {\zref[page]}%
992 }

```

\zrefused For the following expandible user macros \zrefused should be used to notify L<sup>A</sup>T<sub>E</sub>X in case of undefined references.

```

993 \ZREF@IfDefinable\zrefused\def{%
994   {\zref@refused}%
995 }

```

```

996 </user>

```

## 6.4 Module `abspage`

```

997 /*abspage*/
998 \NeedsTeXFormat{LaTeX2e}
999 \ProvidesPackage{zref-abspage}%
1000 [2016/05/16 v2.25 Module abspage for zref (HO)]%
1001 \RequirePackage{zref-base}[2016/05/16]
1002 \ifx\ZREF@base@ok Y%
1003 \else
1004   \expandafter\endinput
1005 \fi

```

Module `abspage` adds a new property `abspage` to the `main` property list for absolute page numbers. These are recorded by the help of package `atbegshi`.

```
1006 \RequirePackage{atbegshi}[2011/10/05]%
```

The counter `abspage` must not go in the clear list of `@ckpt` that is used to set counters in .aux files of included T<sub>E</sub>X files.

```

1007 \begingroup
1008   \let\@addtoreset\ltx@gobbletwo
1009   \newcounter{abspage}%
1010 \endgroup
1011 \setcounter{abspage}{0}%
1012 \AtBeginShipout{%
1013   \stepcounter{abspage}%
1014 }%
1015 \zref@newprop*{abspage}[0]{\the\c@abspage}%
1016 \zref@addprop\ZREF@mainlist{abspage}%

```

Note that counter `abspage` shows the previous page during page processing. Before shipout the counter is incremented. Thus the property is correctly written with deferred writing. If the counter is written using `\zref@wrapper@immediate`, then the number is too small by one.

```
1017 </abspage>
```

## 6.5 Module `counter`

```

1018 /*counter*/
1019 \NeedsTeXFormat{LaTeX2e}
1020 \ProvidesPackage{zref-counter}%

```

```

1021 [2016/05/16 v2.25 Module counter for zref (HO)]%
1022 \RequirePackage{zref-base}[2016/05/16]
1023 \ifx\ZREF@base@ok Y%
1024 \else
1025 \expandafter\endinput
1026 \fi

For features such as hyperref's \autoref we need the name of the counter. The
property counter is defined and added to the main property list.

1027 \zref@newprop{counter}{}
1028 \zref@addprop{\ZREF@mainlist}{counter}

\refstepcounter is the central macro where we know which counter is re-
sponsible for the reference.

1029 \AtBeginDocument{%
1030   \ZREF@patch{refstepcounter}{%
1031     \def\refstepcounter#1{%
1032       \zref@setcurrent{counter}{#1}%
1033       \ZREF@org@refstepcounter{#1}%
1034     }%
1035   }%
1036 }
1037 </counter>

```

## 6.6 Module lastpage

```

1038 /*lastpage*/
1039 \NeedsTeXFormat{LaTeX2e}
1040 \ProvidesPackage{zref-lastpage}%
1041 [2016/05/16 v2.25 Module lastpage for zref (HO)]%
1042 \RequirePackage{zref-base}[2016/05/16]
1043 \RequirePackage{zref-abspage}[2016/05/16]
1044 \RequirePackage{atveryend}[2009/12/07]
1045 \ifx\ZREF@base@ok Y%
1046 \else
1047 \expandafter\endinput
1048 \fi

```

The module `lastpage` implements the service of package `lastpage` by setting a reference `LastPage` at the end of the document. If module `abspage` is given, also the absolute page number is available, because the properties of the main property list are used.

```

1049 \zref@newlist{LastPage}
1050 \AfterLastShipout{%
1051   \if@filesw
1052     \begingroup
1053       \advance\c@page\m@ne

1682         \string\gdef\string\zruns{\zruns}%
1683       }%
1684     \fi
1685   \endgroup
1686 }

1687 </runs>

```

## 6.14 Module `perpage`

```

1688 (*perpage)
1689 \NeedsTeXFormat{LaTeX2e}
1690 \ProvidesPackage{zref-perpage}%
1691   [2016/05/16 v2.25 Module perpage for zref (HO)]%
1692 \RequirePackage{zref-base}[2016/05/16]
1693 \ifx\ZREF@base@ok Y%
1694 \else
1695   \expandafter\endinput
1696 \fi

```

This module resets a counter at page boundaries. Because of the asynchronous output routine page counter properties cannot be asked directly, references are necessary.

For detecting changed pages module `abspage` is loaded.

```
1697 \RequirePackage{zref-abspage}[2016/05/16]
```

We group the properties for the needed references in the property list `perpage`. The property `pagevalue` records the correct value of the page counter.

```

1698 \ZREF@NewPropPageValue
1699 \zref@newlist{perpage}
1700 \zref@addprops{perpage}{abspage,page,pagevalue}

```

The page value, known by the reference mechanism, will be stored in counter `zpage`.

```
1701 \newcounter{zpage}
```

Counter `zref@unique` helps in generating unique reference names.

```
1702 \zref@require@unique
```

In order to be able to reset the counter, we hook here into `\stepcounter`. In fact two nested hooks are used to allow other packages to use the first hook at the beginning of `\stepcounter`.

```

1703 \let\ZREF@org@stepcounter\stepcounter
1704 \def\stepcounter#1{%
1705   \ifcsname @stepcounterhook#1\endcsname
1706     \csname @stepcounterhook#1\endcsname
1707   \fi
1708   \ZREF@org@stepcounter{#1}%
1709 }

```

\zmakeperpage Makro \zmakeperpage resets a counter at each page break. It uses the same syntax and semantics as \MakePerPage from package `perpage` [5]. The initial start value can be given by the optional argument. Default is one that means after the first \stepcounter on a new page the counter starts with one.

```
1710 \ZREF@IfDefinable\zmakeperpage\def{%
1711   {%
1712     @ifnextchar[\ZREF@makeperpage@opt{\ZREF@@makeperpage[\ltx@zero]}{%
1713   }%
1714 }
```

We hook before the counter is incremented in \stepcounter, package `perpage` afterwards. Thus a little calculation is necessary.

```
1715 \def\ZREF@makeperpage@opt [#1]{%
1716   \begingroup

1733     }%
1734 }
```

\ZREF@@perpage@step The heart of this module follows.

```
1735 \def\ZREF@@perpage@step#1#2{%
```

First the reference is generated.

```
1736   \global\advance\c@zref@unique\ltx@one
1737   \begingroup
1738   \expandafter
1739   \zref@labelbylist\expandafter{\thezref@unique}{perpage}%
```

The \expandafter commands are necessary, because \ZREF@temp is also used inside of \zref@labelbylist.

The evaluation of the reference follows. If the reference is not yet known, we use the page counter as approximation.

```
1740   \zref@ifrefundefined{\thezref@unique}{%
1741     \global\c@zpage=\c@page
1742     \global\let\thezpage\thepage
1743     \expandafter\xdef\csname ZREF@abspage@#1\endcsname{%
1744       \number\c@abspage
1745     }%
1746   }{%
```

The reference is used to set \thezpage and counter zpage.

```
1747   \global\c@zpage=\zref@extract{\thezref@unique}{pagevalue}\relax
1748   \xdef\thezpage{\noexpand\zref@extract{\thezref@unique}{page}}%
1749   \expandafter\xdef\csname ZREF@abspage@#1\endcsname{%
```

```

1750      \zref@extractdefault\thezref@unique
1751      {abspage}{\number\c@abspage}%
1752  }%
1753 }%

```

Page changes are detected by a changed absolute page number.

```

1754     \expandafter\ifx\csname ZREF@abspage@\#1\expandafter\endcsname
1755     \csname ZREF@currentabspage@\#1\endcsname
1756   \else
1757     \global\csname c@\#1\endcsname=\#2\relax
1758     \global\expandafter\let
1759     \csname ZREF@currentabspage@\#1\expandafter\endcsname
1760     \csname ZREF@abspage@\#1\endcsname
1761   \fi
1762 \endgroup
1763 }

```

\zunmakeperpage Macro \zunmakeperpage cancels the effect of \zmakeperpage.

```

1764 \ZREF@IfDefinable\zunmakeperpage\def{%
1765 #1{%
1766   \global\expandafter

## 6.15 Module titleref

```

1771 /*titleref*/
1772 \NeedsTeXFormat{LaTeX2e}
1773 \ProvidesPackage{zref-titleref}%
1774 [2016/05/16 v2.25 Module titleref for zref (HO)]%
1775 \RequirePackage{zref-base}[2016/05/16]
1776 \ifx\ZREF@base@ok Y%
1777 \else
1778   \expandafter\endinput
1779 \fi
1780 \RequirePackage{gettitlestring}[2009/12/08]

```

### 6.15.1 Implementation

```
1781 \RequirePackage{keyval}
```

This module makes section and caption titles available for the reference system.  
It uses some of the ideas of package `nameref` and `titleref`.

Now we can add the property `title` is added to the main property list.

```
1782 \ZREF@NewPropTitle
1783 \zref@addprop\ZREF@mainlist{title}%
```

The title strings go into the `.aux` file, thus they need some kind of protection.  
Package `titleref` uses a protected expansion method. The advantage is that this  
can be used to cleanup the string and to remove `\label`, `\index` and other macros  
unwanted for referencing. But there is the risk that fragile stuff can break.

Therefore package `nameref` does not expand the string. Thus the entries can  
safely be written to the `.aux` file. But potentially dangerous macros such as `\label`  
remain in the string and can cause problems when using the string in references.  
The switch `\ifzref@titleref@expand` distinguishes between the both methods.  
Package `nameref`'s behaviour is achieved by setting the switch to false, otherwise  
`titleref`'s expansion is used. Default is false.

	1784 \newif\ifzref@titleref@expand
\ZREF@titleref@hook	The hook \ZREF@titleref@hook allows to extend the cleanup for the expansion method. Thus unnecessary macros can be removed or dangerous commands removed. The hook is executed before the expansion of \zref@titleref@current. 1785 \let\ZREF@titleref@hook\ltx@empty
\zref@titleref@cleanup	The hook should not be used directly, instead we provide the macro \zref@titleref@cleanup to add stuff to the hook and prevents that a previous non-empty content is not discarded accidentally. 1786 \ZREF@Robust\def\zref@titleref@cleanup#1{%  1787   \begingroup  1788   \toks@\expandafter{%  1789     \ZREF@titleref@hook  1790     #1%  1791   }%  1792   \expandafter\endgroup  1793   \expandafter\def\expandafter\ZREF@titleref@hook\expandafter{%  1794     \the\toks@  1795   }%  1796 }%
\ifzref@titleref@stripperiod	Sometimes a title contains a period at the end. Package <code>nameref</code> removes this. This behaviour is controlled by the switch \ifzref@titleref@stripperiod and works regardless of the setting of option <code>expand</code> . Period stripping is the default. 1797 \newif\ifzref@titleref@stripperiod 1798 \zref@titleref@stripperiodtrue
\zref@titleref@setcurrent	Macro \zref@titleref@setcurrent sets a new current title stored in \zref@titleref@current. Some cleanup and expansion is performed that can be controlled by the previous switches. 1799 \ZREF@Robust\def\zref@titleref@setcurrent#1{%  1800   \ifzref@titleref@expand  1801     \GetTitleStringExpand{#1}%  1802   \else  1803     \GetTitleStringNonExpand{#1}%  1804   \fi  1805   \edef\zref@titleref@current{%  1806     \detokenize\expandafter{\GetTitleStringResult}%  1807   }%  1808   \ifzref@titleref@stripperiod  1809     \edef\zref@titleref@current{%  1810       \expandafter\ZREF@stripperiod\zref@titleref@current  1811       \ltx@empty.\ltx@empty\@nil  1812     }%  1813   \fi  1814 }%  1815 \GetTitleStringDisableCommands{%  1816   \ZREF@titleref@hook  1817 }
\ZREF@stripperiod	If \ZREF@stripperiod is called, the argument consists of space tokens and tokens with catcode 12 (other), because of $\varepsilon$ - $\text{\TeX}$ 's \detokenize. 1818 \def\ZREF@stripperiod#1.\ltx@empty#2\@nil{#1}%

### 6.15.2 User interface

\ztitlerefsetup The behaviour of module titleref is controlled by switches and a hook. They can be set by \ztitlerefsetup with a key value interface, provided by package keyval. Also the current title can be given explicitly by the key title.

```

1819 \define@key{ZREF@TR}{expand}[true]{%
1820   \csname zref@titleref@expand#1\endcsname
1821 }%
1822 \define@key{ZREF@TR}{stripperiod}[true]{%
1823   \csname zref@titleref@stripperiod#1\endcsname
1824 }%
1825 \define@key{ZREF@TR}{cleanup}{%
1826   \zref@titleref@cleanup{\#1}%
1827 }%
1828 \define@key{ZREF@TR}{title}{%
1829   \def\zref@titleref@current{\#1}%
1830 }%
1831 \ZREF@IfDefinable\ztitlerefsetup\def{%
1832   {\kvsetkeys{ZREF@TR}}%
1833 }%

```

\ztitleref The user command \ztitleref references the title. For safety \label is disabled to prevent multiply defined references.

```

1834 \ZREF@IfDefinable\ztitleref\def{%
1835   {\zref@wrapper@babel\ZREF@titleref}%
1836 }%
1837 \def\ZREF@titleref#1{%

2089   }%
2090 }%

```

If the `\include` featur was used, there can be several .aux files. These files are read one after another, especially they are not recursively read in order to save read registers. Thus it can happen that the read order of the newlabel commands differs from L<sup>A</sup>T<sub>E</sub>X's order using `\input`.

`\ZREF@xr@externaldocument` It reads the remaining arguments. `\newcommand` comes in handy for the optional argument.

```

## 6.17 Module `hyperref`

```
UNFINISHED :-(  
2418 {*hyperref}  
2419 \NeedsTeXFormat{LaTeX2e}  
2420 \ProvidesPackage{zref-hyperref}{%  
2421 [2016/05/16 v2.25 Module hyperref for zref (HO)]%  
2422 \RequirePackage{zref-base}[2016/05/16]  
2423 \ifx\ZREF@base@ok Y%  
2424 \else  
2425 \expandafter\endinput  
2426 \fi  
2427 \ZREF@NewPropAnchor  
2428 \zref@addprop\ZREF@mainlist{anchor}%  
2429 
```

## 6.18 Module `savepos`

Module `savepos` provides an interface for pdfTeX's `\pdfsavepos`, see the manual for pdfTeX.

### 6.18.1 Identification

```
2430 {*savepos}  
2431 \NeedsTeXFormat{LaTeX2e}  
2432 \ProvidesPackage{zref-savepos}{%  
2433 [2016/05/16 v2.25 Module savepos for zref (HO)]%  
2434 \RequirePackage{zref-base}[2016/05/16]  
2435 \ifx\ZREF@base@ok Y%  
2436 \else  
2437 \expandafter\endinput  
2438 \fi
```

### 6.18.2 Availability

First we check, whether the feature is available.

```
2439 \ltx@ifundefined{pdfsavepos}{%  
2440 \PackageError{\ZREF@name}{%  
2441 string\pdfsavepos\space is not supported.\MessageBreak  
2442 It is provided by pdfTeX (1.40) or XeTeX%  
2443 }\ZREF@UpdatePdfTeX  
2444 \endinput  
2445 }{}}
```

In PDF mode we are done. However support for DVI mode was added later in version 1.40.0. In earlier versions `\pdfsavepos` is defined, but its execution raises an error. Note that XeTeX also provides `\pdfsavepos`.

```
2446 \RequirePackage{ifpdf}  
2447 \ifpdf  
2448 \else  
2449 \ltx@ifundefined{pdftexversion}{%  
2450 }{  
2451 \ifnum\pdftexversion<140 %  
2452 \PackageError{\ZREF@name}{%  
2453 string\pdfsavepos\space is not supported in DVI mode%  
2454 \MessageBreak  
2455 of this pdfTeX version%  
2456 }\ZREF@UpdatePdfTeX
```

```

2457      \expandafter\expandafter\expandafter\endinput
2458      \fi
2459  }%
2460 \fi

```

### 6.18.3 Setup

```

2461 \zref@newlist{savepos}
2462 \zref@newprop*{posx}[0]{\the\pdflastxpos}
2463 \zref@newprop*{posy}[0]{\the\pdflastypos}
2464 \zref@addprops{savepos}{posx,posy}

```

### 6.18.4 User macros

\zref@savepos

```

```

\zposx The horizontal and vertical position are available by \zposx and \zposy. Do not rely on absolute positions. They differ in DVI and PDF mode of pd<sup>T</sup>E<sub>X</sub>. Use differences instead. The unit of the position numbers is sp.

```
2500 \newcommand*\zposx[1]{%
2501   \zref@extract{#1}{posx}%
2502 }%
2503 \newcommand*\zposy[1]{%
2504   \zref@extract{#1}{posy}%
2505 }%
```

Typically horizontal and vertical positions are used inside calculations. Therefore the extracting macros should be expandable and babel's patch is not applicable.

Also it is in the responsibility of the user to mark used positions by \zrefused in order to notify L<sup>A</sup>T<sub>E</sub>X about undefined references.

```

```

## 8 Installation

### 8.1 Download

**Package.** This package is available on CTAN<sup>2</sup>:

[CTAN:macros/latex/contrib/oberdiek/zref.dtx](http://ctan.org/pkg/zref) The source file.

[CTAN:macros/latex/contrib/oberdiek/zref.pdf](http://ctan.org/pkg/zref) Documentation.

**Bundle.** All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](http://ctan.org/pkg/oberdiek.tds.zip)

TDS refers to the standard “A Directory Structure for T<sub>E</sub>X Files” ([CTAN:tds/tds.pdf](http://ctan.org/texmf/tds.pdf)). Directories with `texmf` in their name are usually organized this way.

### 8.2 Bundle installation

**Unpacking.** Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

**Script installation.** Check the directory `TDSScripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

---

<sup>2</sup><http://ctan.org/pkg/zref>

## 8.3 Package installation

**Unpacking.** The `.dtx` file is a self-extracting docstrip archive. The files are extracted by running the `.dtx` through plain TeX:

```
tex zref.dtx
```

**TDS.** Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

<code>zref.sty</code>	$\rightarrow$ <code>tex/latex/oberdiek/zref.sty</code>
<code>zref-base.sty</code>	$\rightarrow$ <code>tex/latex/oberdiek/zref-base.sty</code>

<code>test/zref-test-base.tex</code>	$\rightarrow$ <code>doc/latex/oberdiek/test/zref-test-base.tex</code>
<code>test/zref-test-runs.tex</code>	$\rightarrow$ <code>doc/latex/oberdiek/test/zref-test-runs.tex</code>
<code>test/zref-test-titleref-memoir.tex</code>	$\rightarrow$ <code>doc/latex/oberdiek/test/zref-test-titleref-memoir.tex</code>
<code>zref.dtx</code>	$\rightarrow$ <code>source/latex/oberdiek/zref.dtx</code>

If you have a `docstrip.cfg` that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

## 8.4 Refresh file name databases

If your TeX distribution (teTeX, mikTeX, ...) relies on file name databases, you must refresh these. For example, teTeX users run `texhash` or `mktexlsr`.

## 8.5 Some details for the interested

**Attached source.** The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is pdftk, e.g. unpack the file into the current directory:

```
pdftk zref.pdf unpack_files output .
```

**Unpacking with L<sup>A</sup>T<sub>E</sub>X.** The `.dtx` chooses its action depending on the format:

**plain TeX:** Run docstrip and extract the files.

**L<sup>A</sup>T<sub>E</sub>X:** Generate the documentation.

If you insist on using L<sup>A</sup>T<sub>E</sub>X for docstrip (really, docstrip does not need L<sup>A</sup>T<sub>E</sub>X), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{zref.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

**Generating the documentation.** You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfLATEX:

```
pdflatex zref.dtx
makeindex -s gind.ist zref.idx
pdflatex zref.dtx
makeindex -s gind.ist zref.idx
pdflatex zref.dtx
```

## 9 Catalogue

The following XML file can be used as source for the [TEX Catalogue](#). The elements `caption` and `description` are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is `zref.xml`.

```
3085 (*catalogue)
3086 <?xml version='1.0' encoding='us-ascii'?>
3087 <!DOCTYPE entry SYSTEM 'catalogue.dtd'>
3088 <entry datestamp='$Date$' modifier='$Author$' id='zref'>
3089   <name>zref</name>
3090   <caption>A new reference scheme for LaTeX.</caption>

3093   <license type='lppl1.3' />
3094   <version number='2.25' />
3095   <description>
3096     This package offers a means to remove the limitation, of only two
3097     properties, that is inherent in the way LaTeX's reference system
3098     works. The package implements an extensible referencing system,
3099     where properties are handled in a more flexible way. It provides
3100     an interface for macro programmers to access the new reference
3101     scheme and some applications that use it.
3102   <p/>
3103   The package is part of the <xref refid='oberdiek'>oberdiek</xref>
3104   bundle.
3105 </description>

## 11 History

[2006/02/20 v1.0]

- First version.

[2006/05/03 v1.1]

- Module `perpage` added.
- Module redesign as packages.

[2006/05/25 v1.2]

- Module `dotfillmin` added.
- Module `base`: macros `\zref@require@unique` and `\thezref@unique` added (used by modules `titleref` and `dotfillmin`).

[2006/09/08 v1.3]

- Typo fixes and English cleanup by Per Starback.

[2007/01/23 v1.4]

- Typo in macro name fixed in documentation.

[2007/02/18 v1.5]

- `\zref@getcurrent` added (suggestion of Igor Akkerman).
- Module `savepos` also supports X<sub>E</sub>T<sub>E</sub>X.

## [2007/04/06 v1.6]

- Fix in modules `abspage` and `base`: Now counter `abspage` and `zref@unique` are not remembered by `\include`.
- Beamer support for module `titleref`.

## [2007/04/17 v1.7]

- Package `atbegshi` replaces `everyshi`.

## [2007/04/22 v1.8]

- `\zref@wrapper@babel` and `\zref@refused` are now expandable if `babel` is not used or `\if@safe@actives` is already set to true. (Feature request of Josselin Noirel)

## [2007/05/02 v1.9]

- Module `titleref`: Some support for `\caption` of package `longtable`, but only if `\label` is given after `\caption`.

## [2007/05/06 v2.0]

- Uses package `etexcmds` for accessing  $\varepsilon$ -`TeX`'s `\unexpanded`.

## [2007/05/28 v2.1]

- Module `titleref` supports caption of package `listings`.
- Fixes in module `titleref` for support of packages `titlesec` and `longtable`.

## [2008/09/21 v2.2]

- Module `base`: `\zref@iflistcontainsprop` is documented, but a broken `\zref@listcontainsprop` implemented. Name and implementation fixed (thanks Ohad Kammar).

## [2008/10/01 v2.3]

- `\zref@localaddprop` added (feature request of Ohad Kammar).
- Module `lastpage`: list ‘LastPage’ added. Label ‘LastPage’ will use the properties of this list (default is empty) along with the properties of the main list.

## [2009/08/07 v2.4]

- Module `runs` added.

## [2009/12/06 v2.5]

- Module `lastpage`: Uses package `atveryend`.
- Module `titleref`: Further commands are disabled during string expansion, imported from package `nameref`.

## [2009/12/07 v2.6]

- Version date added for package `atveryend`.

## [2009/12/08 v2.7]

- Module `titleref`: Use of package `gettitlestring`.

## [2010/03/26 v2.8]

- `\zifrefundefined` added.
- Module `lastpage`: Macros `\zref@iflastpage` and `\ziflastpage` added.
- Module `thepage` added.
- Module `nextpage` added.

## [2010/03/29 v2.9]

- Module `marks` added (without documentation).
- `\zref@addprop` now adds expanded property to list.
- Useless `\ZREF@ErrorNoLine` removed.

## [2010/04/08 v2.10]

- Module `xr` remembers the external document name in property ‘`externaldocument`’.

## [2010/04/15 v2.11]

- Module `titleref`: Better support of class `memoir`.
- Module `titleref`: Support of theorems.

## [2010/04/17 v2.12]

- Module `base`: `\zref@newprop` ensures global empty default.
- Module `xr`: Setup options `tozreflabel` and `toltxlabel` added.

## [2010/04/19 v2.13]

- `\zref@setcurrent` throws an error if the property does not exist (Florent Chervet).
- `\zref@getcurrent` the documentation is fixed (Florent Chervet). Also it returns the empty string in case of errors.
- `\zref@addprop` and `\zref@localaddprop` now take a list of property names (feature request of Florent Chervet).
- Example for `\zref@wrapper@unexpanded` corrected (Florent Chervet).

## [2010/04/22 v2.14]

- Bug fix for `\zref@getcurrent` second argument wasn't eaten in case of unknown property.
- `\zref@getcurrent` supports `\zref@wrapper@unexpanded`.
- `\zref@wrapper@unexpanded` added for `\ZREF@xr@tolabel`.
- `\zref@extract`, `\zref@extractdefault`, `\zref@getcurrent` are expandable in exact two steps except inside `\zref@wrapper@unexpanded`.

## [2010/04/23 v2.15]

- `\zexternaldocument` fixed for property ‘url’ when importing `\new@label` (bug found by Victor Ivrii).
- Two expansion steps also in `\zref@wrapper@unexpanded`.
- Nested calls of `\zref@wrapper@unexpanded` possible.

## [2010/04/28 v2.16]

- More consequent use of package ‘ltxcmds’ and ‘hologo’.
- Module `pagelayout` added.
- Module `pageattr` added.
- Robustness introduced for non-expandable interface macros.
- Internal change of the data format of property lists (suggestion of Florent Chervet).
- Module `titleref`: Support of environment description.

## [2010/05/01 v2.17]

- `\zref@newprop` throws an error if the property already exists.
- Module `xr`: Bug fix for the case of several .aux files (bug found by Victor Ivrii).
- Module `xr`: Property ‘urluse’ and option `urluse` added.

## [2010/05/13 v2.18]

- Module `env` added.
- Module `savepos`: `\zref@savepos` added.

## [2010/10/22 v2.19]

- `\zref@addprop` and `\zref@localaddprop` are limited to one property only (incompatibility to versions v2.13 to v2.18).
- `\zref@addprops` and `\zref@localaddprops` added.
- `\zref@delprop` and `\zref@localdelprop` added.
- `\zref@labelbykv` and `\zkvlabel` (module `user`) with keys `prop`, `list`, `delprop`, `immediate`, `values` added.

## [2011/02/12 v2.20]

- Fix for warning in `\zref-xr`.

## [2011/03/18 v2.21]

- Fix in module `pagelayout` for `\zlistpagelayout`.
- Fix for `\zref@localaddprop` (probably since v2.19).

## [2011/10/05 v2.22]

- Documentation fixed for `\zref@{local}addprop(s)`.
- Module base: `\zref@def@extract`, `\zref@def@extractdefault` added.
- Fix in module `pagelayout`: Because of missing `\noexpand` commands the values of the `pagelayout` properties on all pages were the values at package loading.
- Module base: `\zref@showprop` added.

## [2011/12/05 v2.23]

- Module `savepos`: `\zsaveposx` and `\zsaveposy` added.

## [2012/04/04 v2.24]

- Module `titleref`, package `titlesec`: some support for class ‘straight’ (`\ttl@straight@i`) added.

## [2016/05/16 v2.25]

- Documentation updates.

## 12 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
