

The lualibs package

Élie Roux · elie.roux@telecom-bretagne.eu
Philipp Gesang · philipp.gesang@alumni.uni-heidelberg.de

2013/05/04 v2.00

Abstract

Additional Lua functions taken from the `l-*` and `util-*` files of Con_TE_Xt. For an introduction on this package (among others), please refer to the document `lualatex-doc.pdf`.

I Package Description

1 OVERVIEW

Lua is a very minimal language, and it does only have a minimal standard library. The aim of this package is to provide an extended standard library, to be used by various Lua_TE_X packages. The code is specific to Lua_TE_X and depends on Lua_TE_X functions and modules not available in regular lua.

The code is derived from Con_TE_Xt libraries.

2 USAGE

You can either load the `lualibs` module, which will in turn load one of two sets of libraries provided by this package: `require("lualibs")`, or explicitly load the modules you need, e.g.: `require("lualibs-table")`, please note that some modules depend on others.

2.1 *Loading Library Collections*

The libraries are split into a basic and an extended collection. Though neither initialization time nor memory consumption will be noticeably impacted,¹ the `lualibs` package can skip loading of the latter on demand. The `config` table needs to be present prior to loading the package for this to work (in the future this may be achieved by an option of `\usepackage` for \TeX users). In the `lualibs` field, set `load_extended` to false:

```
\directlua{
  --- 1) create config table safely
  config          = config or { }
  config.lualibs   = config.lualibs or { }

  --- 2) unset the load_extended entry
  config.lualibs.load_extended = false

  --- 3) load the lualibs
  require "lualibs"
}
```

However, there is no guarantee that the extended set remains permanently excluded. Re-loading the package at a later point will cancel this option and possibly add the missing libraries.

2.2 *Loading libraries Individually*

In order to load the table module you would actually have to prepare it as follows:

```
require"lualibs-lua"
require"lualibs-lpeg"
require"lualibs-table"
```

If your code is run by the `texlua` interpreter, you will need to initialize `kpse` library so that `require()` can find files under `TEXMF` tree: `kpse.set_program_name("luatex")`.

¹ Note that in terms of code this is only a small fraction of what Con \TeX t loads with every run.

Table 1: The basic set.

lua _{libs} name	ConT _E Xt name	primary purpose
lua _{libs} -lua.lua	l-lua.lua	compatibility
lua _{libs} -package.lua	l-package.lua	Lua file loaders
lua _{libs} -lpeg.lua	l-lpeg.lua	patterns
lua _{libs} -function.lua	l-function.lua	defines a dummy function
lua _{libs} -string.lua	l-string.lua	string manipulation
lua _{libs} -table.lua	l-table.lua	serialization, conversion
lua _{libs} -boolean.lua	l-boolean.lua	boolean converter
lua _{libs} -number.lua	l-number.lua	bit operations
lua _{libs} -math.lua	l-math.lua	math functions
lua _{libs} -io.lua	l-io.lua	reading and writing files
lua _{libs} -os.lua	l-os.lua	platform specific code
lua _{libs} -file.lua	l-file.lua	filesystem operations
lua _{libs} -md5.lua	l-md5.lua	checksum functions
lua _{libs} -dir.lua	l-dir.lua	directory handling
lua _{libs} -unicode.lua	l-unicode.lua	utf and unicode
lua _{libs} -url.lua	l-url.lua	url handling
lua _{libs} -set.lua	l-set.lua	sets

3 FILES

The lua_{libs} bundle contains files from two ConT_EXt Lua library categories: The generic auxiliary functions (original file prefix: l-) together form something close to a standard library. Most of these are extensions of an existing namespace, like for instance l-table.lua which adds full-fledged serialization capabilities to the Lua table library. They were imported under the lua_{libs}-prefix and are contained in the basic collection. (For a list see table 1.)

The extended category comprises a selection of files mostly from the utilities namespace (util-; cf. table 2). Their purpose is more specific and at times quite low-level. Additionally, the file trac-inf.lua has been included because it is essential to some of the code loaded subsequently.

4 PACKAGING

By default, lua_{libs} will not load the libraries individually. Instead, it includes two *merged packages* that have been compiled from the original files. This is achieved by means of mt_x-package, a script for bundling Lua code shipped with ConT_EXt. This concatenates the code of several Lua files into a single file that is both easier to distribute and loading (marginally) faster. mt_x-package ensures that the code from each file gets its own closure and strips newlines and comments, resulting in a smaller payload. Another package that relies on it heavily is the font loader as contained in luaotfload and luatex-fonts.

If ConT_EXt is installed on the system, the merge files can be created by running:

Table 2: The extended set.

lua _{libs} name	ConT _E Xt name	primary purpose
lua _{libs} -util-str.lua	util-str.lua	extra string functions
lua _{libs} -util-tab.lua	util-tab.lua	extra table functions
lua _{libs} -util-sto.lua	util-sto.lua	table allocation
lua _{libs} -util-prs.lua	util-sto.lua	miscellaneous parsers
lua _{libs} -util-dim.lua	util-dim.lua	conversion between dimensions
lua _{libs} -trac-inf.lua	trac-inf.lua	timing, statistics
lua _{libs} -util-lua.lua	util-lua.lua	operations on bytecode
lua _{libs} -util-deb.lua	util-deb.lua	extra debug functionality
lua _{libs} -util-tpl.lua	util-tpl.lua	templating
lua _{libs} -util-sta.lua	util-sta.lua	stacker (e. g. for PDF)
lua _{libs} -util-env.lua	util-env.lua	argv handling
lua _{libs} -util-jsn.lua	util-jsn.lua	conversion to and from json

```
mtxrun --script package --merge lualibs-basic.lua
mtxrun --script package --merge lualibs-extended.lua
```

Of course there is a make target for that:

```
make merge
```

will take care of assembling the packages from the files distributed with lua_{libs}.

For this to work, the syntax of the Lua file needs to be well-formed: files that should be merged must be included via a function `loadmodule()`. It doesn't matter if the function actually does something; a dummy will suffice. Also, the argument to `loadmodule()` must be wrapped in parentheses. This rule is quite convenient, actually, since it allows excluding files from the merge while still using `loadmodule()` consistently.

```
...
loadmodule("my-lua-file.lua") -- <= will be merged
loadmodule('my-2nd-file.lua') -- <= will be merged
loadmodule "my-3rd-file.lua" -- <= will be ignored
...
```

Note that there is one exception to the packaging: `lualibs-util-jsn.lua` cannot be successfully packaged because it follows a different coding convention, returning a Lua table on exit. Therefore, the file is loaded separately as part of the extended set like any other Lua module.

II lua_{libs}.lua

```

1 lualibs = lualibs or { }
2
3 lualibs.module_info = {
4   name      = "lualibs",
5   version    = 2.00,
6   date       = "2013/04/30",
7   description = "ConTeXt Lua standard libraries.",
8   author     = "Hans Hagen, PRAGMA-ADE, Hasselt NL & Elie Roux & Philipp Gesang",
9   copyright   = "PRAGMA ADE / ConTeXt Development Team",
10  license    = "See ConTeXt's mreadme.pdf for the license",
11 }
12

```

The behavior of the lualibs can be configured to some extent.

- Based on the parameter `lualibs.prefer_merged`, the libraries can be loaded via the included merged packages or the individual files.
- Two classes of libraries are distinguished, mainly because of a similar distinction in ConTeXt, but also to make loading of the less fundamental functionality optional. While the “basic” collection is always loaded, the configuration setting `lualibs.load_extended` triggers inclusion of the extended collection.
- Verbosity can be increased via the `verbose` switch.

```

13
14 config      = config or { }
15 config.lualibs = config.lualibs or { }
16
17 if config.lualibs.prefer_merged == nil then
18   lualibs.prefer_merged = true
19 end
20 if config.lualibs.load_extended == nil then
21   lualibs.load_extended = true
22 end
23 config.lualibs.verbose = config.lualibs.verbose == false
24

```

The lualibs may be loaded in scripts. To account for the different environment, fallbacks for the luatexbase facilities are installed.

```

25
26 local dofile      = dofile
27 local kpsefind_file = kpse.find_file
28 local stringformat = string.format
29 local texiowrite_nl = texio.write_nl
30
31 local find_file, error, warn, info
32 do
33   local _error, _warn, _info
34   if luatexbase and luatexbase.provides_module then
35     _error, _warn, _info = luatexbase.provides_module(lualibs.module_info)
36   else

```

```

37  _error, _warn, _info = texiowrite_nl, texiowrite_nl, texiowrite_nl
38  end
39
40  if lualibs.verbose then
41    error, warn, info = _error, _warn, _info
42  else
43    local dummylogger = function ( ) end
44    error, warn, info = _error, dummylogger, dummylogger
45  end
46  lualibs.error, lualibs.warn, lualibs.info = error, warn, info
47 end
48
49 if luatexbase and luatexbase.find_file then
50   find_file = luatexbase.find_file
51 else
52   kpse.set_program_name"luatex"
53   find_file = kpsefind_file
54 end
55

```

The lualibs load a merged package by default. In order to create one of these, the meta file that includes the libraries must satisfy certain assumptions mt_x-package makes about the coding style. Most important is that the functions that indicates which files to include must go by the name `loadmodule()`. For this reason we define a `loadmodule()` function as a wrapper around `dofile()`.

```

56
57 local loadmodule = loadmodule or function (name, t)
58   if not t then t = "library" end
59   local filepath = find_file(name, "lua")
60   if not filepath or filepath == "" then
61     warn(stringformat("Could not locate %s \"%s\".", t, name))
62     return false
63   end
64   dofile(filepath)
65   return true
66 end
67
68 lualibs.loadmodule = loadmodule
69

```

The separation of the “basic” from the “extended” sets coincides with the split into `luat-bas.mkiv` and `luat-lib.mkiv`.

```

70
71 if lualibs.basic_loaded ~= true then
72   loadmodule"lualibs-basic.lua"
73   loadmodule"lualibs-compat.lua" --- restore stuff gone since v1.*
74 end
75
76 if lualibs.load_extended == true
77 and lualibs.extended_loaded ~= true then

```

```

78 loadmodule"lualibs-extended.lua"
79 end
80
81 --- This restores the default of loading everything should a package
82 --- have requested otherwise. Will be gone once there is a canonical
83 --- interface for parameterized loading of libraries.
84 lualibs.load_extended = true
85
86 -- vim:tw=71:sw=2:ts=2:expandtab
87

```

III lualibs-basic.lua

```

1 lualibs          = lualibs or { }
2 local info       = lualibs.info
3 local loadmodule = lualibs.loadmodule
4
5 local lualibs_basic_module = {
6   name      = "lualibs-basic",
7   version   = 2.00,
8   date      = "2013/04/30",
9   description = "ConTeXt Lua libraries -- basic collection.",
10  author    = "Hans Hagen, PRAGMA-ADE, Hasselt NL & Elie Roux & Philipp Gesang",
11  copyright  = "PRAGMA ADE / ConTeXt Development Team",
12  license    = "See ConTeXt's mreadme.pdf for the license",
13 }
14
15 local loaded = false --- track success of package loading
16
17 if lualibs.prefer_merged then
18   info"Loading merged package for collection "basic"."
19   loaded = loadmodule('lualibs-basic-merged.lua')
20 else
21   info"Ignoring merged packages."
22   info"Falling back to individual libraries from collection "basic"."
23 end
24

```

mtx-package expects the files to be included by loadmodule. If run on this file, it will create lualibs-basic-merged.lua from all the files mentioned in the next block.

```

25
26 if loaded == false then
27   loadmodule("lualibs-lua.lua")
28   loadmodule("lualibs-package.lua")
29   loadmodule("lualibs-lpeg.lua")
30   loadmodule("lualibs-function.lua")
31   loadmodule("lualibs-string.lua")
32   loadmodule("lualibs-table.lua")
33   loadmodule("lualibs-boolean.lua")

```

```

34 loadmodule("lua1libs-number.lua")
35 loadmodule("lua1libs-math.lua")
36 loadmodule("lua1libs-io.lua")
37 loadmodule("lua1libs-os.lua")
38 loadmodule("lua1libs-file.lua")
39 loadmodule("lua1libs-md5.lua")
40 loadmodule("lua1libs-dir.lua")
41 loadmodule("lua1libs-unicode.lua")
42 loadmodule("lua1libs-url.lua")
43 loadmodule("lua1libs-set.lua")
44 end
45
46 lua1libs.basic_loaded = true
47 -- vim:tw=71:sw=2:ts=2:expandtab
48

```

IV lua¹libs-extended.lua

```

1 lua1libs = lua1libs or { }
2

```

Loading the *extended* set requires a tad more effort, but it's well invested.

Since we only want the functionality, we have to simulate parts of a running ConT_EXt environment, above all logging, that some of the more involved libraries cannot be loaded without. Also, one utility file cannot be packaged because it returns a table which would preclude loading of later code. Thus, we remove it from the natural loading chain (it is not critical) and append it at the end.

```

3
4 local lua1libs_extended_module = {
5   name          = "lua1libs-extended",
6   version       = 2.00,
7   date          = "2013/04/30",
8   description    = "ConTEXt Lua libraries -- extended collection.",
9   author         = "Hans Hagen, PRAGMA-ADE, Hasselt NL & Elie Roux & Philipp Gesang",
10  copyright      = "PRAGMA ADE / ConTEXt Development Team",
11  license        = "See ConTEXt's mreadme.pdf for the license",
12 }
13
14
15 local stringformat = string.format
16 local loadmodule   = lua1libs.loadmodule
17 local texiowrite    = texio.write
18 local texiowrite_nl = texio.write_nl
19

```

Here we define some functions that fake the elaborate logging/tracking mechanism Con-text provides.

```

20
21 local error, logger, mklog

```

```

22 if luatexbase and luatexbase.provides_module then
23   --- TODO test how those work out when running tex
24   local __error, ___, __logger =
25     luatexbase.provides_module(lualibs_extended_module)
26   error = __error
27   logger = __logger
28   mklog = function ( ) return logger end
29 else
30   mklog = function (t)
31     local prefix = stringformat("[%s] ", t)
32     return function (...)
33       texiowrite_nl(prefix)
34       texiowrite (stringformat(...))
35     end
36   end
37   error = mklog"ERROR"
38   logger = mklog"INFO"
39 end
40
41 local info = lualibs.info
42

```

We temporarily put our own global table in place and restore whatever we overloaded afterwards.

ConTeXt modules each have a custom logging mechanism that can be enabled for debugging. In order to fake the presence of this facility we need to define at least the function `logs.reporter`. For now it's sufficient to make it a reference to `mklog` as defined above.

```

43
44 local dummy_function = function ( ) end
45 local newline      = function ( ) texiowrite_nl"" end
46
47 local fake_logs = function (name)
48   return {
49     name      = name,
50     enable    = dummy_function,
51     disable   = dummy_function,
52     reporter  = mklog,
53     newline   = newline
54   }
55 end
56
57 local fake_trackers = function (name)
58   return {
59     name      = name,
60     enable    = dummy_function,
61     disable   = dummy_function,
62     register  = mklog,
63     newline   = newline,
64   }

```

```

65 end
66

```

Among the libraries loaded is `util-env.lua`, which adds ConTeXt's own, superior command line argument handler. Packages that rely on their own handling of arguments might not be aware of this, or the library might have been loaded by another package altogether. For these cases we provide a copy of the original arg list and restore it after we are done loading.

```

67
68 local backup_store = { }
69
70 local fake_context = function ( )
71   if logs      then backup_store.logs      = logs      end
72   if trackers then backup_store.trackers = trackers end
73   logs        = fake_logs"logs"
74   trackers    = fake_trackers"trackers"
75
76   backup_store.argv = table.fastcopy(arg)
77 end
78
79

```

Restore a backed up logger if appropriate.

```

80 local unfake_context = function ( )
81   if backup_store then
82     local bl, bt = backup_store.logs, backup_store.trackers
83     local argv   = backup_store.argv
84     if bl then logs      = bl      end
85     if bt then trackers = bt      end
86     if argv then arg     = argv    end
87   end
88 end
89
