

The `fcltxdoc`* package

Private additional `ltxdoc` support.

FC

2011/03/12 – version 1.0

Abstract

`fcltxdoc` provides some facilities to print documentation (`.dtx`) files. Most of them are further development of commands defined in the undocumented package `holttxdoc`.

The package makes a strong use of `hyperref` and the syntax has been thought to be easy.

`fcltxdoc` is not intended for public use... ..but it may be used – or copied – by the public!

It is required to compile – with pdf \TeX – some of my documentation files.

Contents

1	The main macros: <code>\cs</code>, <code>\env</code>, <code>\M</code>, <code>\stform</code>, <code>declcs</code>, <code>declenv</code>	1

v1.0	[2011/02/27]	21

1 The main macros: `\cs`, `\env`, `\M`, `\stform`, `declcs`, `declenv`

<code>\cs{Command}</code>	<code>\cs*{Command}</code>	<code>\cs[font]{Command}</code>	<code>\cs*[font]{Command}</code>
<code>\cs\Command</code>	<code>\cs*\Command</code>	<code>\cs[font]\Command</code>	<code>\cs*[font]\command</code>
	<code>\cs\Command*</code>		<code>\cs{Command}*</code>

The control sequence `\cs` prints a control sequence. Both syntaxes are possible, with star form for the presented command:

* This documentation is produced with the DocStrip utility.
→ To get the package, run: `etex fcltxdoc.dtx`
→ To get the documentation run (thrice): `pdflatex fcltxdoc.dtx`
To get the index, run: `makeindex -s gind.ist fcltxdoc.idx`
The `.dtx`file is embedded into this pdf file thank to `embedfile` by H. Oberdiek.

Source file	Result (typesetting)
<code>\cs{Command}</code> or <code>\cs\Command</code>	<code>\Command</code>
<code>\cs{Command}*</code> or <code>\cs\Command*</code>	<code>\Command*</code>

If the control sequence has been declared with the `declcs` environment then a hyperlink is created automatically (`\cs{Command}` becomes the same as `\ref{declcs.\string\Command}` and `\cs*` the same as `\ref*{declcs.\string\Command}`: in other words, `\cs*` avoids the hyperlink).

With the syntax `\cs\Command`, the argument (`\Command`) is collected in a context where `@` is a letter. This syntax does not work in moving arguments: inside the title of a `\section` for example, the only syntax `\cs{Command}` shall be used.

`\begin` and `\end` have a natural special behaviour: if followed by `{` the sequence:

`\cs\begin{environment}`
is replaced by: `\cs\begin\M*{\env{environment}}`

`\cs[\textbf]\Command` allows to print the control sequence in boldface: `\Command` and `\cs[\color{red}]\Command` prints it red: `\Command`. This extension and the star form should be avoided in moving arguments. In the process of PDF string encoding, `\cs` is redefined to be equal to `\string` with the possibility to write `\cs\Command` as well. Useful for PDF comments or bookmarks. To disable hyperlinks inside section titles for example, a hook must be set, for example in the `(font)` key of a package that provides formatting for sectioning commands (example with `titlesec`:

`\sectionformat\section {font+ =\def\csref{\ref*}}`
or : `\sectionformat\section {before+ =\def\csref{\ref*}}`

or in the table of contents only with the `tocloft` package:

`\tocsetup {before+ =\def\csref{\ref*}}`).

More generally, the font in which the control sequence is displayed is stored in the macro `\cs@font`, by default: `{\hypersetup {linkcolor=csrefcolor}\textt}`.

<code>\env{environment}</code>	<code>\env*{environment}</code>	<code>\env[font]{envir}</code>	<code>\env*[font]{envir}</code>
<code>\env{environment}*</code>	<code>\env*{environment}*</code>	<code>\env[font]{envir}*</code>	<code>\env*[font]{envir}*</code>

The control sequence `\env` prints the name of an environment (in `\ttfamily` font). When followed by a star the word “environment” is inserted after the name:

Source file	Result (typesetting)
<code>\env{name}</code> or <code>\env{name}*</code>	<code>name</code> or <code>name environment</code>

If the environment has been declared (with the `declenv` environment) then a hyperlink is created automatically (`\env{name}` becomes the same as `\ref{declcs.\string\name}`, with `\env*` it becomes the same as `\ref*{declcs.\string\name}`: in other words, `\env*` avoids the hyperlink).

Moreover, `\env[itshape]{environment}` will print the name in italic: *environment*. This extension, as well as the star form should be avoided in moving arguments.

<code>\M{arg}</code>	<code>\M[arg]</code>	<code>\M(arg)</code>	<code>\M arg </code>
<code>\M*{arg}</code>	<code>\M*[arg]</code>	<code>\M*(arg)</code>	<code>\M* arg </code>

`\M` is a general command to typeset arguments: the star form `\M*` removes the “angle brackets” around. Braces, square brackets, parenthesis and vertical bar `|` are supported, whatever there category code are and even if they change alongside the document.

`\M` is not allowed in pdf strings (an explicit `\texorpdfstring` construction is required).

```
\stform*  \stform+  \stform-  \stform|  etc.
```

`\stform` is named for “*starred form*”. The star `\stform*` is printed with `\textasteriskcentered`, and for the other symbols `\stform` expands to `\string`. The font is `\ttfamily\bfseries`.

`\stform` is robust (*ie.* can be used inside moving arguments) and can be used inside pdf strings: in this case it expands to `\string`.

Example: a vertical bar | can be printed with `\stform|`.

```
\begin{declcs}[preamble][<font>]{Command}  \\
  Other \cs or \csanchor...
\end{declcs}\declcsbookmark\Command
      or
\begin{declcs}[preamble][<font>]\Command  \\
\end{declcs}
```

The `declcs` environment (also defined in `holtxdoc`) presents a control sequence. Like for `\cs`, both syntaxes for the argument are allowed:

```
\begin{declcs}{Command}  or  \begin{declcs}\Command.
```

The environment is typeset inside a single-framed `tabu` with only one column whose preamble is `{ 1 }`. It is possible to change the preamble, add columns *etc.* with the optional argument. The second optional argument allows to change the font of `\Command`. Finally if the first optional argument is empty, it defaults to `[1]` so that:

```
\begin{declenv}[][\itshape]\Command
is the same as: \begin{declenv}[ 1 ][\itshape]\Command
```

`\declcsbookmark` can be used at the end of the `declcs` environment to add a bookmark whose text is `\Command`, whose level is `rellevel=1`, `keeplevel`: see the `bookmark` package.

Further formatting of the `tabu` environment can be obtained easily with the `etoolbox` hook:

```
\AtBeginEnvironment  and  \tabusetup*
```

For example, in this very documentation the setting is:

```
\AtBeginEnvironment{declcs} { \changeont{size+ =1pt}
\tabusetup* {everyrow=\rowcolor{WhiteSmoke!60},rule width=\heavyrulewidth}
```

An anchor and a label are set, for further references by the `\cs` command. The anchor is set by the command `\csanchor`, which share the same syntax as `\cs` and can be used alone if required.

```
\begin{declcs*}[preamble][<font>]{Command}  \\
  Other \cs or \csanchor...
\end{declcs*}
      or
\begin{declcs*}[preamble][<font>]\Command  \\
\end{declcs*}
```

`declcs*` is a variant of `declcs` which is based on `longtabu` instead of `tabu`.

Used to present a command with a long list of keys for example, for page breaks are allowed.

```
\begin{declenv}[preamble]{name of the environment}\M*[options]\M*{parameter}  \\
  content of the environment (optional)
\end{declenv}
```

The `declenv` environment is designed to present an environment. Just like `declcs` an anchor and a label are set, for references by the `\env` command. The anchor is set by the `\envanchor` command which share the same syntax as `\env` and can be used alone if required.

2 Some other macros and extensions

<code>\xext{⟨file extension⟩}</code>	<code>\xext{⟨file extension⟩}*</code>
<code>\xpackage{package name}</code>	<code>\xpackage{package name}*</code>
<code>\xclass{class name}</code>	<code>\xclass{class name}*</code>
<code>\xfile{file name}</code>	<code>\xfile{file name}*</code>
<code>\xmodule{module name}</code>	<code>\xmodule{module name}*</code>

`\xext` is defined by holtxdocto print – in `\ttfamily`– a file extension preceded by a dot:

```
\xext{aux}      .aux
```

`fcltxdoc` redefines the command with the same * extension the `\env` command provides:

Source file	Result (typesetting)
<code>\xext{aux}</code>	→ .aux
<code>\xext{aux}*</code>	→ .aux file
<code>\xpackage{package}*</code>	→ package package
<code>\xclass{class}*</code>	→ class class
<code>\xfile{filename}*</code>	→ filename file
<code>\xmodule{module}*</code>	→ module module

3 The package options

3.1 The `[nopackages]` option

Every command is defined with `\providecommand`, `\providrobustcmd` or `\provide` (from `ltxnew`).

The package option `[nopackages]` avoids the loading of the packages. Nevertheless, the commands provided by `fcltxdoc` are provided and some of them will certainly lead to an `undefined control sequence` if a package is missing: this option is only useful if one loads (some of) the required packages at a later or previous time, or if only a “chosen set” of the commands provided here are used.

Packages loaded by `fcltxdoc` with the `[nopackages]` option

etex v2.0 eTeX basic definition package (PEB)

ltxnew v1.3 provides the new and renew prefixes for checking definitions

etexcmds v1.5 Prefix for e-TeX command names (HO)

ltxcmds v1.20 LaTeX kernel commands for general use (HO)

etoolbox v2.1 e-TeX tools for LaTeX

Packages loaded by `fcltxdoc` without the `[nopackages]` option

etex v2.0 eTeX basic definition package (PEB)

ltxnew v1.3 provides the new and renew prefixes for checking definitions

etexcmds v1.5 Prefix for e-TeX command names (HO)

ltxcmds v1.20 LaTeX kernel commands for general use (HO)

etoolbox v2.1 e-TeX tools for LaTeX

[T1]fontenc

graphicx v1.0f Enhanced LaTeX Graphics (DPC,SPQR)

grffile v1.13 Extended file name support for graphics (HO)

[svgnames,table]xcolor v2.11 LaTeX color extensions (UK)

needspace v1.3c reserve vertical space

moresize v1.9 (more font sizes)

relsize ver 3.1

manfnt 0.2LaTeX2e manfnt package

[official]eurosym v1.1 European currency symbol “Euro”

fancyhdr	
lastpage	v0.1b LaTeX2e package for refs to last page number (JPG)
marginnote	v1.1f non floating margin notes for LaTeX
framed	v 0.95: framed or shaded text with page breaks
newgeometry	
[explicit]titlesec	v2.9.1 Sectioning titles
tocloft	v2.3e parameterised ToC, etc., typesetting
[hyperfoontotes]hyperref	v6.82j Hypertext links for LaTeX
bookmark	v1.21 PDF bookmarks (HO)
hybmsec	v2.4 Bookmarks in sectioning commands (HO)
enumitem-zref	
fancyvrb	
listings	1.4 (Carsten Heinz)
nccfoots	v1.2 NCC Footnotes Package (NCC)
nccstretch	v1.0 Text Stretch Package (NCC)
linegoal	v3.0 - Measuring the remaining width of the line (FC)
delarray	v1.01 array delimiter package (DPC)
multirow	
makecell	V0.1e Managing of Tab Column Heads and Cells
booktabs	v1.61803 publication quality tables
embedfile	v2.6 embed files into PDF (HO)
interfaces	v3.2 – pgfkeys interfaces for packages (FC)
pgf	v2.10 (rcs-revision 1.12)
tikz	v2.10 (rcs-revision 1.76)

3.2 The `[$$]` package option

The `[$$]` option makes `§` an active character whose meaning is `\par\nobreak`.

`§§` is defined as `\par\nobreak\vskip –\parskip`.

pkgcolor	color for the package name printed with <code>\thispackage</code>
csrefcolor	color for the references to the commands defined by the package (<code>\cs</code>)
macrocode	color for the code in the <i>implementation</i> part.
linkcolor	<code>\hypersetup {linkcolor=linkcolor}</code> : <code>\colorlet{linkcolor}{green}</code> has generally the same effect as <code>\hypersetup {linkcolor=green}</code>
urlcolor	<i>Idem</i> : <code>\hypersetup {urlcolor=urlcolor}</code>
filecolor	<i>Idem</i> : <code>\hypersetup {filecolor=filecolor}</code>
menucolor	<i>Idem</i> : <code>\hypersetup {menucolor=menucolor}</code>
runcolor	<i>Idem</i> : <code>\hypersetup {runcolor=runcolor}</code>

Those colors shall be chosen after `\begin{document}`: `\colorlet{pkgcolor}{blue}` for example.

5 Implementation

5.1 Identification, Options and Requirements

```

1 (*package)
2 \NeedsTeXFormat{LaTeX2e}[2005/12/01]
3 \ProvidesPackage{fcltxdoc}
4   [2011/03/12 v1.0 - Private additional ltxdoc support (FC)]
5 \RequirePackage{etex}\def\etex@loggingall{\tracingall\tracingonline\z@}
6 \reserveinserts 3
7 \RequirePackage{filehook}
8 \RequirePackage{ltxnew,etexcmds,ltxcmds,etoolbox} % general tools (commands)

```

Minimal catcode ascertaining for loading fcltxdoc in good conditions:

```

9 \AtEndOfPackage{\fcltx@AtEnd\let\fcltx@AtEnd\undefined}
10 \def\fcltx@AtEnd{}
11 \def\TMP@EnsureCode#1={%
12   \edef\fcltx@AtEnd{\fcltx@AtEnd
13     \catcode#1\the\catcode#1}%
14   \catcode#1=%
15 }% \TMP@EnsureCode
16 \TMP@EnsureCode 33 = 12 % !
17 \TMP@EnsureCode 58 = 12 % :
18 \TMP@EnsureCode 124 = 12 % | = text bar
19 \TMP@EnsureCode 36 = 3 % $ = math shift
20 \TMP@EnsureCode 38 = 4 % & = tab alignment character
21 \TMP@EnsureCode 32 = 10 % space
22 \TMP@EnsureCode 94 = 7 % ^
23 \TMP@EnsureCode 95 = 8 % _

```

Options

```

24 \DeclareOption{amsmath}{\AtEndOfPackage{%

5.3 `\cs`, hyper links and `key=value`

`\cs`, `\csanchor` and `\env`

`\cs` prints a control sequence: both syntaxes: `\M*name` and `\name` are allowed.

`\csanchor` `\csanchor` puts an anchor (generally made inside the `declcs` environment) and a label.

If the label exists, then `\cs` puts a hyperlink to this label: in this case, `\cs` is just `\ref{declcs.name}`.

Spacing around the control sequences are adjusted by `\spacefactor = 2999` (for a fixed width font, the space is not stretchable: `\spacefactor = 2999` will double the space, and this is too much).

```

5.9 Verbatim support inside \output routine

\FC@DefineCommandChars The `Verbatim` environment provided by package `fancyvrb` allow to define some special command chars for escape char character (`\catcode = 0`), open group character (`\catcode = 1`) and close group character (`\catcode = 2`), by the mean of the key:

$$\text{commandchars}=\langle\text{escapechar}\rangle\langle\text{opengroup}\rangle\langle\text{closegroup}\rangle.$$

If a page break occurs while inside the `Verbatim` environment, the standard category codes are not restored, and the `\output` routine may break (if for example, a file is read during the output routine).

Here, **\FV@DefineCommandChars** is redefined in order to ignore the special category codes of verbatim command characters category codes

```

588 \AtEndOfPackageFile*{fancyvrb}{%
589 \renewcommand*\FV@DefineCommandChars [3]{%
590   \edef\FV@restoreCommandChars{\catcode`\noexpand#1 =\the\catcode`#1
